Main textbook (Explanation - Theory).

10.1 Introduction

10.2 Wave function; Schrodinger Wave Equation

10.3 Operators in QM

10.4 Physical interpretation of  $\psi$ ; Probability density

10.5 Normalisation of the wave function

10.6 Probability current density; Conservation of probability

10.7 Separation of space and time in Schrodinger equation;  
Time-independent Schrodinger equation

10.8 Eigenfunctions and Eigenvalues

10.9 Probability of stationary states

10.10 Degeneracy

10.11 Averages in QM; Expectation values

10.12 Expectation values and correspondence principle;  
Ehrenfest's theorem

10.13 Formal proof of the uncertainty principle

10.14 Hermitian operators

10.15 Some properties of Hermitian operators

10.16 Reality of eigenvalues of Hermitian operators

10.17 Equations of motion in QM

10.18 Fundamental postulates of QM

**Chapter 2 Basic Developments (Textbook: QM DeMystified by David McMahon).**

Supporting textbook. Simplified in context to advanced college level textbooks - Recommended.

2.1 Schrodinger equation

2.2 Solving the Schrodinger equation

2.3 Probability interpretation and normalisation

2.4 Expansion of wavefunction and finding coefficients

2.5 Phase of wavefunction

2.6 Operators in QM

2.7 Momentum of the uncertainty principle

2.8 Conservation of probability

**Chapter 6 of QM For UGs.**

**Mahesh C Jain.**

Supporting textbook.

6.1 Necessity for a wave equation and conditions imposed on it

6.2 The time-dependent Schrodinger equation

6.3 Statistical interpretation of the wave function and conservation probability

6.4 Expectation values of dynamical variables

6.5 Motion of wave packets: Ehrenfest theorem

6.6 Exact statement and proof of the position-momentum uncertainty product

6.7 Wave packet having minimum uncertainty product

6.8 Time-independent Schrodinger equation:

stationary states, degeneracy, reality of eigenvalues, orthogonality of eigenfunctions,  
parity, continuity and boundary conditions.

6.9 Free particle

### Comments:

*This topic Schrodinger Equation (SE) has its place in context to wave functions.*

*Its NOT for me an easy material to understand, comprehend, master,....., apply,.....  
There are numerous books written on it at year 3 and 4 levels. So why should I/We attempt to master it as though I/We need it to solve our problems? One answer to this is its required for the topics that follow after some comprehension of Schrodinger equations in wave functions. SE solves problems in 3 dimension.*

*Its hard to find worked examples that results in values (numerical answers) most are theoretical or expressions for an answers. Thats hard for me.*

*I am 100% sure there are many smart ones who know this subject matter well and teach it at many universities world wide. That is not questioned here. Its just us few who need help in this topic.*

### Objective:

*Get some feel OR understanding of the subject matter so we can progress into the continuing topics. We can identify this as an INTERMEDIATE level topic. Schrodinger equation and its related subject matter can be seen as an OBSTACLE, it is to me, so why not call it the intermediate level. For me its a hurdle before the other topics in QM.*

[QM Demystified A Self Teaching Guide by David McMahon.](#) <--- I purchased this book in 2007. Read chapter 2 in that year. Ddid not get past it but did complete chapter 2. This book made it possible for me to understand the basic maths required for the topic. I revisited it again in 2019 and 2020. Had it not been for McMahon's book, Schrodinger Equation may not been a subject matter I could understand. I admit I may still be incomplete on its understanding. So there maybe mistakes here that you can easily spot. Apologies in advance.

Its just the math techniques required to understand some of the undergraduate Schrodinger Equation subject. Just 85 pages, tried to make it as step by step as possible. 21 example in all. You may need to zoom in at higher magnification.

[Any errors and omissions apologies in advance.](#)

### Problem 6.1 (Demystified textbook)

Two functions,  $\psi$  and  $\phi$ , be defined for  $0 \leq x < \infty$ .

Explain why  $\psi(x) = x$  is NOT a wave function but  $\phi(x) = e^{-x^2}$  is a wave function.

*Don't be let down by this somewhat simple looking example!*

#### **Solution:**

From your textbook there are 4 criteria to meet this requirement:

1. single valued
2. continuous over the range
3. differentiable
4. square integrable ..... read this as shown below.

$$\int_{-\infty}^{\infty} |\psi(x)|^2 dx < \infty$$

Lets apply the 4 criteria for  $\psi(x) = x$

$$\psi(x) := x$$

1. For each value of  $x$  we have a value for the expression  $\psi(x)$ .

*A single-valued function is function that, for each point in the domain, has a unique value in the range. It is therefore one-to-one or many-to-one.*

2. Since the range is from 0 to infinity, we have a value for  $\psi(x)$  for each  $x$  its continuous over the range.
3. Differentiate  $x$ ?  $d(x)/dx = 1$ . Differentiable. Its a constant.  
Met the first 3 criteria.
4. Square integrable?  $x \rightarrow x^2$

$$\int_0^3 x^2 dx = 9 \quad \text{If the upper limit was 3 we have an answer its square integrable, but our problem is upper limit is infinity not 3.}$$

$$\int_{-\infty}^{\infty} |\psi(x)|^2 dx < \infty \quad \text{If the function is positive --> valued, then limits are 0 to +infinity.} \quad \int_0^{\infty} |\psi(x)|^2 dx < \infty$$

$$\int_0^{\infty} (x^2) dx < \infty \quad \left(\frac{1}{3}\right) \cdot x^3 \quad \text{Limits } 0 \rightarrow \text{infinity}$$

Result of intergration:  $(1/3)x^3$ .

When  $x = \text{infinity}$ ,  $(1/3)(\text{infinity})^3 = \text{infinity}$ .

When  $x = 0$ , result = 0.

Infinity - 0 = Infinity. This is not less than Infinity.

So fail.

It is NOT a wave function. **Ans.**

Solution continued on next page.

Lets apply the 4 criteria for  $\phi(x) = e^{-x^2}$       $\psi(x) := e^{-x^2}$

1. For each value of x we have a value for the expression  $\phi(x)$ .

$$\phi(x) := e^{-x^2} \quad \phi(0) = 1 \quad \phi(3) = 1.455 \cdot 10^{169}$$

2. Since the range is from 0 to infinity, we have a value for  $\phi(x)$  for each value of x so its continous over the range.

3. Differentiate  $e^{-x^2}$ ?

$$\text{Let } u = -x^2 \quad du/dx = -2x.$$

$$y = e^u \quad dy/du = e^u$$

$$dy/dx = (dy/du)(du/dx)$$

$$dy/dx = (e^u)(-2) = -2xe^u = -2xe^{-x^2}$$

Differentiable.

4. Square intergrable?

$$y = |(e^{-x^2})|^2$$

$$y = e^{-2x^2}$$

$$\int_0^{\infty} e^{-2x^2} dx$$

Not an easy one to intergrate. **RESORT** to integral tables for exponential terms.

Tables:

$$\int_0^{\infty} e^{-a \cdot x^2} dx = \left(\frac{1}{2}\right) \cdot \sqrt{\left(\frac{\pi}{a}\right)}$$

$$a = 2 \quad \left(\frac{1}{2}\right) \cdot \sqrt{\left(\frac{\pi}{2}\right)} = \left(\frac{1}{4}\right) \left(\frac{1}{2}\right) \cdot \sqrt{(\pi)} = \sqrt{\left(\frac{\pi}{8}\right)}$$

$$\int_0^{\infty} e^{-2x^2} dx = \sqrt{\left(\frac{\pi}{8}\right)} \quad \text{Its intergrable!}$$

It is a valid candidate for a wavefunction. **Ans.**

**Comment:** It was the author David McMahon choice of word 'candidate'. Interesting to know it may fail elsewhere! Not a 100%? For now it is a wavefunction!

Problem 6.2 (Demystified textbook)

Consider a particle trapped in a well with potential given by:

$$V(x) = 0 \quad \text{when } 0 \leq x \leq a$$

$$V(x) = \text{infinity when otherwise}$$

Show that  $\Psi(x,t) = A \sin(kx) \exp(i Et / \hbar)$  solved the Schrodinger equation provided that

$$E = (\hbar^2 k^2) / (2m)$$

**Solution:**

$$\Psi := 1 \quad x := 1 \quad t := 1 \quad E := 1 \quad \leftarrow \text{So you may not see the red rectangle.}$$

Comment:

This may change from problem to problem, but what is the purpose of the Schrodinger Equation?

Quantities, (example the position, momentum, velocities,...etc), of the particle (electron, neutron, proton,...etc), which appear in the old quantum theory cannot be precisely determined because of the uncertainty principle, and hence cannot describe the behaviour of the atomic system.

*That appears to be the problem, so what was the solution?*

Hisenberg invented the matrix mechanics. This was further improved or developed by Born and Jordan. Soon afterwards Erwin Schrodinger developed the wave mechanics on the basis of DeBroglie's hypothesis of wave-particle duality, and proposed a wave equation for describing the motion of atomic systems. - (Ghosal, Modern Physics Vol I).

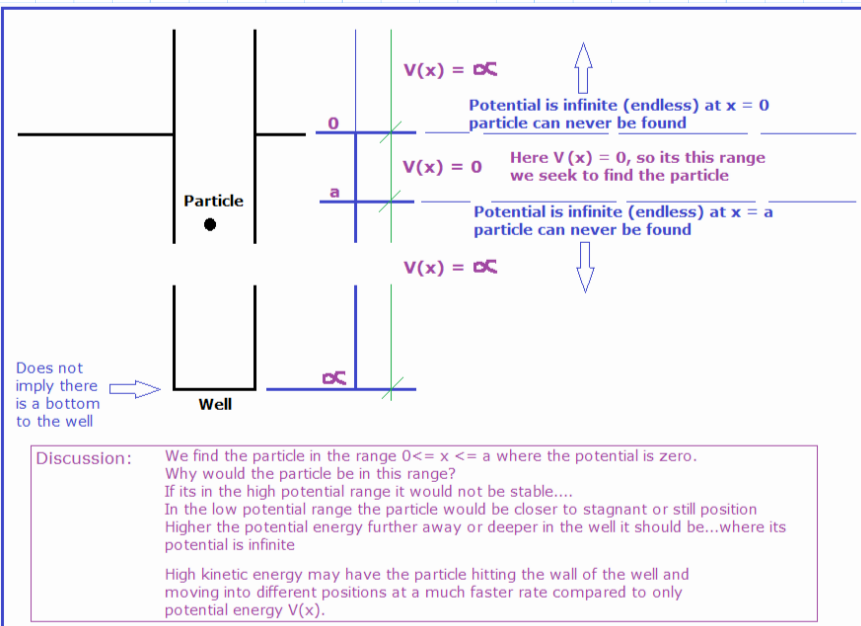

Figure to the left serves to assist in the problem's solution.

Where the  $V(x) = 0$  the potential is low so the force acting on the particle is negligible compared to where  $V(x)$  is very high. See discussion in box. KE as an addition would make it worst.

 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Let  $\Psi$  (upper case) be the 1 dimensional wave function shown in the terms below:

$$\text{wave function} = \Psi(x, t)$$

$$\text{lhs} := i \cdot h' \left( \frac{d}{dt} (\Psi(x, t)) \right) \quad \leftarrow \text{Ignore the small red rectangles over the variable caused by the text editor in software. Its because the variable was not defined. We are NOT computing merely using the text editor.}$$

$$\text{rhs\_term1} := - \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} (\Psi(x, t)) \right) \quad \text{rhs\_term2} := V(x) \cdot \Psi(x, t)$$

The general One Dimensional Schrodinger expression.

Note: rhs\_term2 is not applicable in this problem.

The one dimensional time-dependent Schrodinger's wave equation is:

lhs = rhs\_term 1 + rhs\_term 2..... $\Psi$  shown multiplied through.

You find the equation in your recommended textbook.

Our problem equation is:

$$\text{lhs} = \text{rhs\_term 1}$$

$$\Psi(x, t) := A \cdot \sin(k \cdot x) e^{\frac{-i \cdot E \cdot t}{h'}}$$

Derivative of the lhs term above w.r.t. t:

$$i \cdot h' \frac{d}{dt} \Psi(x, t) = i \cdot h' \cdot \left( \frac{-i \cdot E}{h'} \right) \cdot \left( A \cdot \sin(k \cdot x) e^{\frac{-i \cdot E \cdot t}{h'}} \right)$$

Since  $i \times -i = -i^2 = -(-1) = 1$ , above RHS term becomes positive

$$i \cdot h' \frac{d}{dt} \Psi(x, t) = E \cdot \left( A \cdot \sin(k \cdot x) e^{\frac{-i \cdot E \cdot t}{h'}} \right) = E \cdot \Psi(x, t)$$

Continuing with the derivative of  $\Psi(x, t)$  w.r.t. x:

$$\frac{d}{dx} \Psi(x, t) = \frac{d}{dx} \left( A \cdot \sin(kx) e^{\frac{-i \cdot E \cdot t}{h'}} \right) = k \cdot A \cdot \cos(kx) e^{\frac{-i \cdot E \cdot t}{h'}}$$

Now for the rhs\_term1 evaluate it:

$$- \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} (\Psi(x, t)) \right) = - \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} \left( k \cdot A \cdot \cos(kx) \cdot e^{\frac{-i \cdot E \cdot t}{h'}} \right) \right)$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\begin{aligned}
 &= -\left(\frac{\hbar^2}{2m}\right) \left(-k^2 \cdot A \cdot \sin(kx) \cdot e^{\frac{-i \cdot E \cdot t}{\hbar}}\right) \\
 &= \left(\frac{\hbar^2}{2m}\right) (k^2) \cdot \left(A \cdot \sin(kx) \cdot e^{\frac{-i \cdot E \cdot t}{\hbar}}\right) \\
 &= \left(\frac{\hbar^2}{2m}\right) (k^2) \cdot \Psi(x, t)
 \end{aligned}$$

Returning to our earlier expression:

$$\text{lhs} = \text{rhs\_term1}$$

$$i \cdot \hbar \left( \frac{d}{dt} (\Psi(x, t)) \right) = -\left(\frac{\hbar^2}{2m}\right) \cdot \left( \frac{d^2}{dx^2} (\Psi(x, t)) \right)$$

Now equating both terms results:

$$E \cdot \Psi(x, t) = \left(\frac{\hbar^2}{2m}\right) (k^2) \cdot \Psi(x, t)$$

Solving for E by canceling  $\Psi(x, t)$ . Then we say the Schrodinger equation is satisfied for the given expression for E.

$$E = \left(\frac{\hbar^2 \cdot k^2}{2m}\right) \quad \text{Ans.}$$

This is what we accomplished:

'Showed the WAVE FUNCTION  $\Psi(x, t) = A \sin(kx) \exp(i Et / \hbar)$  solved the Schrodinger equation provided

$$E = (\hbar^2 k^2) / (2m)'$$

Comments:

*Its not 'thinking out of the box'? Phrase you often hear, but getting the boundary set for where  $V(x)$  is infinite and 0 was a problem me, and I maybe wrong I see within 0 to a as in the box and elsewhere out. In the box  $V(x)$  is zero, and outside infinity. Why is it so difficult to say in the box  $V(x) = 0$ , and elsewhere infinite?*

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Problem 6.3 ( QM DeMystified David McMahon )

Suppose  $\Psi(x,t) = A(x - x^3)e^{(-iEt/\hbar)}$ .

$$\Psi(x,t) := A(x - x^3) \cdot e^{\frac{-i \cdot E \cdot t}{\hbar}}$$

Find  $V(x)$  such that the Schrodinger equation is satisfied.

**Solution:**

$$-\left(\frac{\hbar^2}{2m}\right) \cdot \left(\frac{d^2}{dx^2}(\Psi(x,t))\right) + V(x) \cdot \Psi(x,t) = \left(\frac{(\hbar^2 \cdot k^2)}{2 \cdot m} + V(x)\right) \cdot \Psi(x,t)$$

.....Atomic Physics (Ghoshal) page 244, something like this with a slight change here with  $\Psi(x,t)$  shown instead of just  $\Psi$  without the variables  $x$ , and  $t$ . Of course it be in context.....

D. McMahon identifies  $\Phi(x)$  as the spatial part of the  $\Psi(x,t)$  expression above. Spatial because it only has variable  $x$  (space-spatial).

$$\Phi(x) := A(x - x^3)$$

So now 
$$\Psi(x,t) := \Phi(x) \cdot e^{\frac{-i \cdot E \cdot t}{\hbar}}$$

$$-\left(\frac{\hbar^2}{2m}\right) \cdot \left(\frac{d^2}{dx^2}(\Phi(x))\right) + V(x) \cdot \Phi(x) = (E) \cdot \Phi(x) \quad \text{We use this eq for the solution.}$$

Above eq 'Separation of space and time in Schrodinger equation: Time independent Schrodinger equation.'

$$\left(-\frac{\hbar^2}{2m} \nabla^2 + V(r)\right) \Psi(r) = E \Psi(r)$$

$$\nabla^2 \Psi(r) + \frac{2m}{\hbar^2} (E - V(r)) \Psi(r) = 0$$

<--- Eq we use in this solution as D McMahon shows, similar found on page 253.

Since  $V(x)$  is spatial we do not need to work with the whole  $\Psi(x,t)$  equation, instead just  $\Phi(x)$ . Something we would never had thought ourselves, to drop part of the expression would be a crime!

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Lets look at the right had side of the equation  $E \Phi(x)$

$$E \cdot \Phi(x) = E \cdot (A \cdot (x - x^3))$$

What we do next is a few similar derivatives and plugin's to match up the equation of concern. We do this often!

$$\frac{d^2}{dx^2} (\Phi(x)) \quad ?$$

$$\frac{d^1}{dx^1} (\Phi(x)) = A - A \cdot 3 \cdot x^2$$

$$\frac{d^2}{dx^2} (\Phi(x)) = -A \cdot 6 \cdot x$$

Match up expression:

$$-\left(\frac{h^2}{2m}\right) \cdot \left(\frac{d^2}{dx^2} (\Phi(x))\right) = -\left(\frac{h^2}{2m}\right) \cdot -A \cdot 6 \cdot x$$

Now the eq looks like this:

$$-\left(\frac{h^2}{2m}\right) \cdot -A \cdot 6 \cdot x + V(x) \cdot A(x - x^3) = (E) \cdot A(x - x^3)$$

$$\left(\frac{h^2}{2m}\right) \cdot A \cdot 6 \cdot x + V(x) \cdot A(x - x^3) = (E) \cdot A(x - x^3) \quad \text{Change sign.}$$

Let's not place excessive thinking into this we want to solve for  $V(x)$  within the definiton of the 'Schrodinger Equation'.

Rearranging:

$$V(x) \cdot A(x - x^3) = (E) \cdot A(x - x^3) - \left(\frac{h^2}{2m}\right) \cdot A \cdot 6 \cdot x \quad \text{Divide boty sides by } A(x - x^3)$$

$$V(x) = E - \frac{\left(\frac{h^2}{2m}\right) \cdot 6 \cdot x}{(x - x^3)} = E - \frac{h^2 \cdot 6 \cdot x}{2 \cdot m \cdot (x - x^3)} \quad \text{Ans.}$$

### Problem 6.4: Normalising A Wavefunction.

Chapter 2 of QM DeMystified (D McMahon).

A wave function for a particle confined to  $0 \leq x \leq a$  in the ground state, was found to be

$$\psi(x) := A \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$$

where A is the normalisation constant.

- 1). Find A?
- 2). Determine the probability that the particle is found in the interval  $(a/2) \leq x \leq (3a/4)$ .

**Solution:**

*In electrical engineering you come across normalisation process in signals, and power systems. We find it here in QM and surely in other engineering fields.*

*Question: Is the process the same?*

*My answer NO. Why? Because each time I come across it I have forgotten the procedure and have to start from the beginning. I hope I am not alone, if I am it does trouble me.*

*Its an important requirement for solving Schrodinger Equation problems. This is a good example to use for reference.*

**Notes:**

A wavefunction  $\psi(x,t)$ , space and time, solves a Schrodinger Equation.  
If this function is multiplied by an undetermined constant A, it becomes  $A \psi(x,t)$

$$A \cdot \psi(x, t)$$

Why is it undetermined? You see it in example 6.5, where a solution of a differential equation takes the form:

$$\psi(x, t) := A \cdot \sin(k \cdot x) + B \cdot \cos(k \cdot x)$$

The solution has constant variables/expressions A and B, they need to be solved. So the normalisation process here is one method of doing so. It maybe the only I do not know that for sure, either way we need to solve for the constant expression A and B. Example 6.5 uses the solution here.

$$\int_{-\infty}^{\infty} |A^2 \cdot \psi(x, t)|^2 dx = 1 \quad \frac{1}{A^2} = \int_{-\infty}^{\infty} |\psi(x, t)|^2 dx \quad \text{Solve for A.}$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\int_{-\infty}^{\infty} |\psi(x, t)|^2 dx = 1$$

<--- The meaning of this integral expression is that the particle (electron,...neutron,...whatever) is located somewhere within the space of concern with complete certainty.

The limits on our integral will not be from +infinity through - infinity, rather from 'a' through 0 as provided for x. This is where we expect to find the particle!

1). Find A? So lets begin the steps of this normalisation

$$\int_0^a |\psi(x, t)|^2 dx = \int_0^a A^2 \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) dx = A^2 \int_0^a \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) dx$$

Simple trig identity solves this;  $\sin^2(u) = (1 - \cos(2 \cdot u))/2$   
 substitute  $u = (\pi x)/2$  into the expression.

$$= A^2 \int_0^a \frac{1 - \cos \cdot 2 \cdot \left(\frac{\pi \cdot x}{a}\right)}{2} dx = \frac{A^2}{2} \left( \int_0^a 1 - \cos \cdot 2 \cdot \left(\frac{\pi \cdot x}{a}\right) dx \right)$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$= \frac{A^2}{2} \left( \int_0^a 1 \, dx \right) - \frac{A^2}{2} \left( \int_0^a \cos \cdot \left( \frac{2 \cdot \pi \cdot x}{a} \right) dx \right) \quad \dots 2 \text{ terms here integrate them individually.}$$

$$\frac{A^2}{2} \left( \int_0^a 1 \, dx \right) = \frac{A^2}{2} [x] \dots a - 0 = \frac{A^2}{2} [a] - \frac{A^2}{2} \cdot [0]$$

$$= \frac{A^2}{2} (a)$$

For the second term we set  $u = (2 \pi x)/a$

$$\frac{d}{dx}(u) = \frac{2 \cdot \pi}{a}$$

$$du = \frac{2 \cdot \pi}{a} \cdot dx$$

$$\int_0^a \cos \cdot \left( \frac{2 \cdot \pi \cdot x}{a} \right) dx = \left( \frac{a}{2 \cdot \pi} \right) \cdot \int_0^{2 \cdot \pi} \cos(u) \, du$$

The limits change, the expression is evaluated to  $2\pi - 0$ , because the trig term makes a full circle in 360 degrees ( $2\pi$ )...here infinity in the sense of linear distance will not apply, time does apply when applicable.

for the cosine term

$$\left( \frac{a}{2 \cdot \pi} \right) \cdot \int_0^{2 \cdot \pi} \cos(u) \, du = \sin(u) \quad \dots \lim 2\pi - 0$$

$$\left( \frac{a}{2 \cdot \pi} \right) \cdot (\sin(2 \cdot \pi) - \sin(0)) = 0 - 0 \quad \text{2nd term results in zero.}$$

Only the first term results with a value/expression after evaluating, this is what we have:

$$\int_0^a \psi(x) \, dx = \frac{A^2}{2} (a) = 1 \quad \text{Correct, this is how we perceive the solution's path.}$$

A is called the normalisation constant, we now can solve for it now:

$$A^2 = \frac{2}{a} \quad A = \sqrt{\frac{2}{a}}$$

We started with in the question:  $\psi(x) := A \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Substituting in A which was evaluated:

$$\psi(x) := A \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$$

The normalised function:

$$\psi(x, t) = \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \quad \text{Ans. The solution to part 1.}$$

2). Determine the probability that the particle is found in the interval

$$(a/2) \leq x \leq (3a/4).$$

In part 1's solution we found the normalisation function and constant. Here we use the function from its original form with it's absolute squared. That is the probability.

$$P\left(\left(\frac{a}{2}\right) \leq x \leq \left(\frac{3a}{4}\right)\right) = \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} |\psi(x)|^2 dx = \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} |\psi(x)|^2 dx$$

$$\text{Substituting } \psi(x) := A \cdot \sin\left(\frac{\pi \cdot x}{a}\right) = \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$$

$$\int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} \left| \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \right|^2 dx = \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} \left(\frac{2}{a}\right) \cdot \sin^2\left(\frac{\pi \cdot x}{a}\right) dx$$

Its obvious the evaluation we are doing is a little different, the sine term is of the 2nd order.

$$\left(\frac{2}{a}\right) \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} \frac{1 - \cos \cdot 2 \cdot \left(\frac{\pi \cdot x}{a}\right)}{2} dx = \left(\frac{1}{a}\right) \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} 1 dx - \left(\frac{1}{a}\right) \int_{\frac{a}{2}}^{\frac{3 \cdot a}{4}} \cos\left(\frac{2 \cdot \pi \cdot x}{a}\right) dx$$

$$\left(\frac{1}{a}\right) [x] - \left(\frac{1}{a}\right) \cdot \left(\frac{a}{2 \cdot \pi}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$$

limit (3a/4) to (a/2)      limit (3a/4) to (a/2)  
 1st term                              2nd term

1st term:

$$\left(\frac{1}{a}\right) \left(\frac{3a}{4} - \frac{a}{2}\right) = \left(\frac{1}{a}\right) \left(\frac{a}{4}\right) = \left(\frac{1}{4}\right)$$

2nd term:

$$\left(\frac{1}{a}\right) \cdot \left(\frac{a}{2 \cdot \pi}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right) = -\left(\frac{1}{2 \cdot \pi}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$$

limit (3a/4) to (a/2)

$$-\left(\frac{1}{2 \cdot \pi}\right) \cdot \sin\left(2 \pi \cdot \left(\frac{3a}{4a}\right)\right) + \left(\frac{1}{2 \cdot \pi}\right) \cdot \sin\left(2 \pi \cdot \left(\frac{a}{2a}\right)\right)$$

$$-\left(\frac{1}{2 \cdot \pi}\right) \cdot \sin\left(\frac{6 \pi}{4}\right) + \left(\frac{1}{2 \cdot \pi}\right) \cdot \sin(\pi) = \left(\frac{1}{2 \cdot \pi}\right) \cdot \left(\sin\left(\frac{6 \pi}{4}\right) - \sin(\pi)\right)$$

$$-\left(\frac{1}{2 \cdot \pi}\right) \cdot \left(\sin\left(\frac{3 \pi}{2}\right) - \sin(\pi)\right) \quad \sin(\pi) = 0 \text{ in radians}$$

$$-\left(\frac{1}{2 \cdot \pi}\right) \cdot \sin\left(\frac{3 \pi}{2}\right) \quad \sin\left(\frac{3 \pi}{2}\right) = -1 \text{ in radians}$$

$$-\left(\frac{1}{2 \cdot \pi}\right) \cdot (-1)$$

$$\frac{1}{2 \pi}$$

Returning to both parts of the intergral's result

$$P\left(\left(\frac{a}{2}\right) \leq x \leq \left(\frac{3a}{4}\right)\right) = \left(\frac{1}{4}\right) + \left(\frac{1}{2 \pi}\right) = \frac{4 \pi + 4}{8 \pi} = \frac{\pi + 2}{4 \pi}$$

$$\frac{\pi + 2}{4 \pi} = 0.409 \quad \text{Ans in radian}$$

Probability is 40.9%? Yes, the unit in radian could return a result anywhere from 0.0 to 1.0. Discuss it with your local engineer.

Problem 6.5 (Demystified textbook) Revisiting Problem 6.2

Short introduction. What D McMahon said in QM DeMystefied.

*D McMahon: Most of the time, we are given a specific potential and asked to find the form of the wavefunction.*

*My response: Thats difficult. I prefer just plugin numbers.*

*D McMahon: ...this involves solving a boundary value problem, process of applying boundary conditions to find a solution to a differential equation.*

*My response: Differential equations? Thats the separating line! Its a difficult topic for me....LaPlace Tranforms.....all that! Hopefully David is right for your sake because I'm not planning on using them at work or for a hobby.*

Problem 6.5

Consider a particle trapped in a well with potential given by:

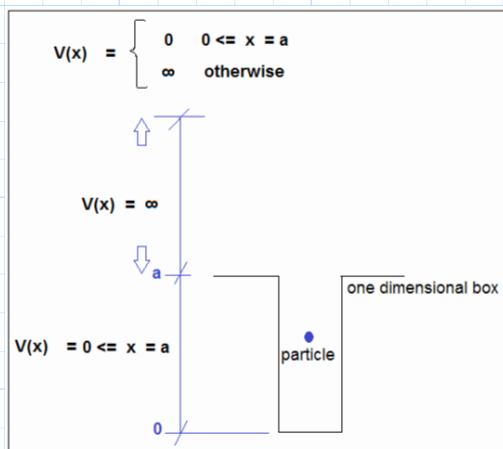

$$V(x) = 0 \quad \text{when } 0 \leq x \leq a$$

$$V(x) = \text{infinity when otherwise}$$

$$V(x) = \begin{cases} 0 & 0 \leq x \leq a \\ \infty & \text{otherwise} \end{cases} \quad \leftarrow \text{-----Usually how you see....but do you notice the boundary conditions? Yes!}$$

Solve the Schrodinger equation for this potential.

**Solution:**

This figure serves to assist in the solution. If you find something wrong with it, correct it.

Non-Commercial Use Only

1). [Main Textbook](#): QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: [Quantum Mechanics for 'Power Plant Engineering' Studies](#).  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$(i \cdot h') \cdot \left( \frac{d^1}{dx^1} \Psi(x, t) \right) = - \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} \Psi(x, t) \right) + V(x) \cdot \Psi(x, t) \quad \text{Eq..1.1}$$

We use this eq for the solution as per D McMahon.  
 Same equation found in Atomic Physics page 244, equation 10.2-7.  
 Schrodinger eq for one dimensional [time dependent](#), (x,t) motion.  
 We have spatial x and time t, (x,t).

In the equation above  $V(x) = 0$ , as per our boundary condition.  
 So that whole term goes to zero.

$$V(x) := 0$$

$$V(x) \cdot \Psi(x, t) = 0$$

So now the equation is

$$(i \cdot h') \cdot \left( \frac{d}{dx} \Psi(x, t) \right) = - \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} \Psi(x, t) \right) \quad \text{Eq..1.2}$$

In the equation above, the term  $\Psi(x,t)$  is separable. This was shown in a previous example.

$$\Psi(x, t) = \Psi(x) \cdot f(t) \quad \text{we have spatial } x, \text{ and time } t \text{ separated in to 2 different functions.}$$

The LHS of Eq 1.2 is first derivative this leads to a simple solution to the time dependent part of the wavefunction

$$f(t) := e^{\frac{-i \cdot E \cdot t}{h'}} \quad \text{where } E \text{ is the energy.}$$

When we apply the separation to Eq 1.2 we have a [time independent](#) expression of Schrodinger equation. The time indendent Schrodinger equation is shown below.

$$- \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} (\Psi(x)) \right) + V(x) \cdot \Psi(x) = (E) \cdot \Psi(x)$$

Since  $V(x) = 0$  the equation becomes

$$- \left( \frac{h'^2}{2m} \right) \cdot \left( \frac{d^2}{dx^2} (\Psi(x)) \right) = (E) \cdot \Psi(x) \quad \text{Next we turn this eq into a differential equation form whose typical solution we have.}$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

So we multiply both sides by  $\left(\frac{2 \cdot m}{h^2}\right)$

$$-\left(\frac{d^2}{dx^2}(\Psi(x))\right) + \left(\frac{2 \cdot m}{h^2}\right) \cdot (E) \cdot \Psi(x) = 0$$

we have a 2nd derivative equation which needs some simplification.

Let  $k^2 = (2mE/h^2)$        $k\_squared := \frac{2 \cdot m \cdot E}{h^2}$

$$-\left(\frac{d^2}{dx^2}(\Psi(x))\right) + k^2 \cdot \Psi(x) = 0$$

Look up your Diff.Eq. textbook, a solution for this equation is a sinusoidal expression.

Solution for eq above is:

$$\Psi(x) := A \cdot \sin(k \cdot x) + B \cdot \cos(k \cdot x)$$

Which you may had known or found in the math textbook.

What is the problem now?

We need to solve for **A** and **B** in the expression above.

Using the boundary conditions, we apply them to the equation.

We say  $V(x)$  is infinite at  $x=0$  and  $x=a$ , outside the box.  
 Within the box  $V(x) = 0$ .

At  $x = 0$

$$\begin{aligned} \Psi(x=0) &\rightarrow \Psi(x\_equal\_Zero) := A \cdot \sin(k \cdot 0) + B \cdot \cos(k \cdot 0) \\ &\Psi(x\_equal\_Zero) := A \cdot \sin(0) + B \cdot \cos(0) \\ &\Psi(x\_equal\_Zero) := B \end{aligned}$$

How we interpret this?

When  $B=0$ ,  $\Psi(0) = A \sin(kx)$ .....Correct!

*Almost missed that because of the number fixated mind, there is a value that the answer, sadly this isnt that subject!*

$$\Psi(x\_equal\_zero) := A \cdot \sin(k \cdot x) \quad \text{Ans. This makes the wave function.}$$

We only used one boundary condition, what I refer to as inside the box, where  $0 \leq x \leq a$ .

What happens at the 'a' side of the boundary?

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Recall, what we were looking for was the WAVEFUNCTION....and D McMahon said most of the time you will be searching for this function rather than a single numerical value.

A wavefunction like a signal would run thru '0 <= x <= a' into the region outside the box. So the wavefunction would require the same result at x=a, as it was for x=0. This wavefunction is expected to be continuous everywhere. The solution will satisfy inside the well (box) and outside. Logical!

So, at x=a

$$\Psi(x_{\text{equal } a}) := A \cdot \sin(k \cdot a) = 0$$

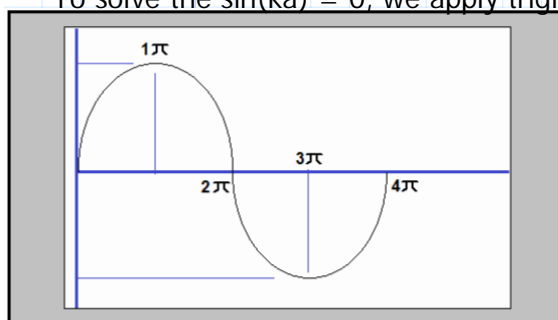

What is the problem here? How do we make that 0.  
 $\sin(ka) = 0$  ?

**Comments:** D McMahon says if the wavefunction is ZERO everywhere then there is no particle present in any of the boundary conditions.

You may say if the wavefunction was zero everywhere, to begin with what value had function, but in another way hence there was no particle, for the particle was experiencing that wavefunction's ride to exist in the boundary condition(s).

Maybe! .....*ride that wave!*

To solve the  $\sin(ka) = 0$ , we apply trigonometry and pi.

$\sin(ka) = 0$ , what is of concern here is ka.

$$ka = n(\pi)$$

$$n = 1, 2, 3, \dots$$

n cannot equal 0 because  $\sin(0) = 0$  !

$$k = n(\pi)/a$$

so now we re-write the wavefunction.

so we dont get any red flag from the software text editor we set  $n = 1$   $n := 1$

$$\Psi(x) := A \cdot \sin\left(\frac{(n \cdot \pi)}{a} \cdot x\right) \quad \text{Ans. ...this is the latest wavefunction which may do it.}$$

Do we need to solve for A? No, its just a 'coefficient or constant or may be a variable' provided in part of the Diff Eq solution's form.

But what about  $k^2 = 2mE/h^2$ ....which we set earlier in the steps to the answer?  
**E** being the energy of the particle should give some indication of where it is sitting in the boundary, remember the potential is time independent and the solution to the Schrodinger equation was given as:

$$\Psi(x, t) = \Psi(x) \cdot f(t) \quad f(t) := e^{\frac{-i \cdot E \cdot t}{\hbar}} \quad \Psi(x) \cdot e^{\frac{-i \cdot E \cdot t}{\hbar}}$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

So, maybe E has a role in the solution.

However, 'A' may be solved in the 'Schrodinger Normalisation' OR 'Normalising the Wavefunction' process which is more a mathematical procedure. Which you may have seen in the previous examples, this will be attended to later. At this stage we are more concerned in the Energy (E) role in the solution.

$$k\_squared := \frac{2 \cdot m \cdot E}{h^2}$$

$$E := \frac{k^2 \cdot (h^2)}{2 \cdot m} \quad \text{simple enough now substitute for k}$$

$$E := \frac{(n^2 \cdot \pi^2) \cdot (h^2)}{2 \cdot m \cdot a^2} \quad \text{Ans. Solves the energy related to the wavefunction for } n = 1, 2, 3, \dots$$

Logically n cannot equal 0 because E would result in 0. No Energy.

The first value n can assume is n = 1.

n=1 is the lowest energy state which you identify as the 'ground state energy'.

We may be able to generate some plots with the results achieved thus far. by setting n=1,2,3.... and mass m of an electron.

Constants:

$$h := 6.63 \cdot 10^{-34} \quad \text{Js} \quad m_{\text{electron}} = 9.1 \cdot 10^{-31}$$

$$h' := \frac{h}{2 \pi} = 1.055 \cdot 10^{-34}$$

'a' can take on any positive value....its the distance in reference to 0 in the box or well.

Here we set a = 3, as it was by McMahon in his example.

n values take on a change in the plots.

$$E1 := \frac{(1^2 \cdot \pi^2) \cdot (h^2)}{2 \cdot m_{\text{electron}} \cdot 3^2} = 6.709 \cdot 10^{-39} \quad \text{when } n = 1$$

$$E2 := \frac{(2^2 \cdot \pi^2) \cdot (h^2)}{2 \cdot m_{\text{electron}} \cdot 3^2} = 2.684 \cdot 10^{-38} \quad \text{when } n = 2$$

$$E3 := \frac{(3^2 \cdot \pi^2) \cdot (h^2)}{2 \cdot m_{\text{electron}} \cdot 3^2} = 6.038 \cdot 10^{-38} \quad \text{when } n = 3$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\Psi(x) := A \cdot \sin\left(\frac{(n \cdot \pi)}{a} \cdot x\right)$$

We set  $n = 1, 2,$  and  $3$  and  $a = 3$   
 for the plots, with  $x$  taking on a range  $0 - 1,$  and  $1 - 1.$

Plot 1:  $n = 1, a = 3.$

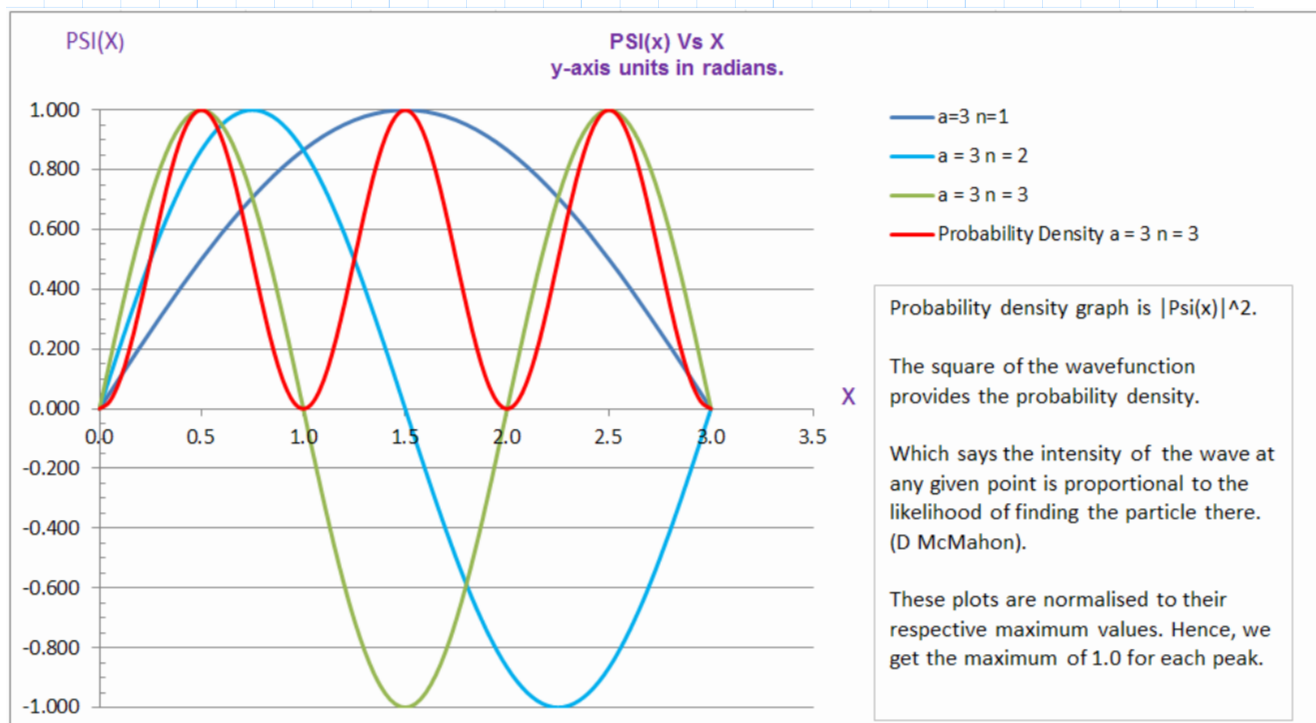

Plot 2:  $n = 2, a = 3.$

Plot 3:  $n = 3, a = 3.$

Plot 4: Is probability density of plot 3,  $|\Psi(x)|^2.$

Graphs using Excel. Matching d McMahon pages 22-23.

Conclusion from plot 4: The particle is most likely to be found at  
 $x = 0.5, 1.5,$  and  $2.5$  where the plot peaks at 1.  
 Least likely to be found at  $x = 1,$  and  $2$  where it peaks at 0. **Ans.**

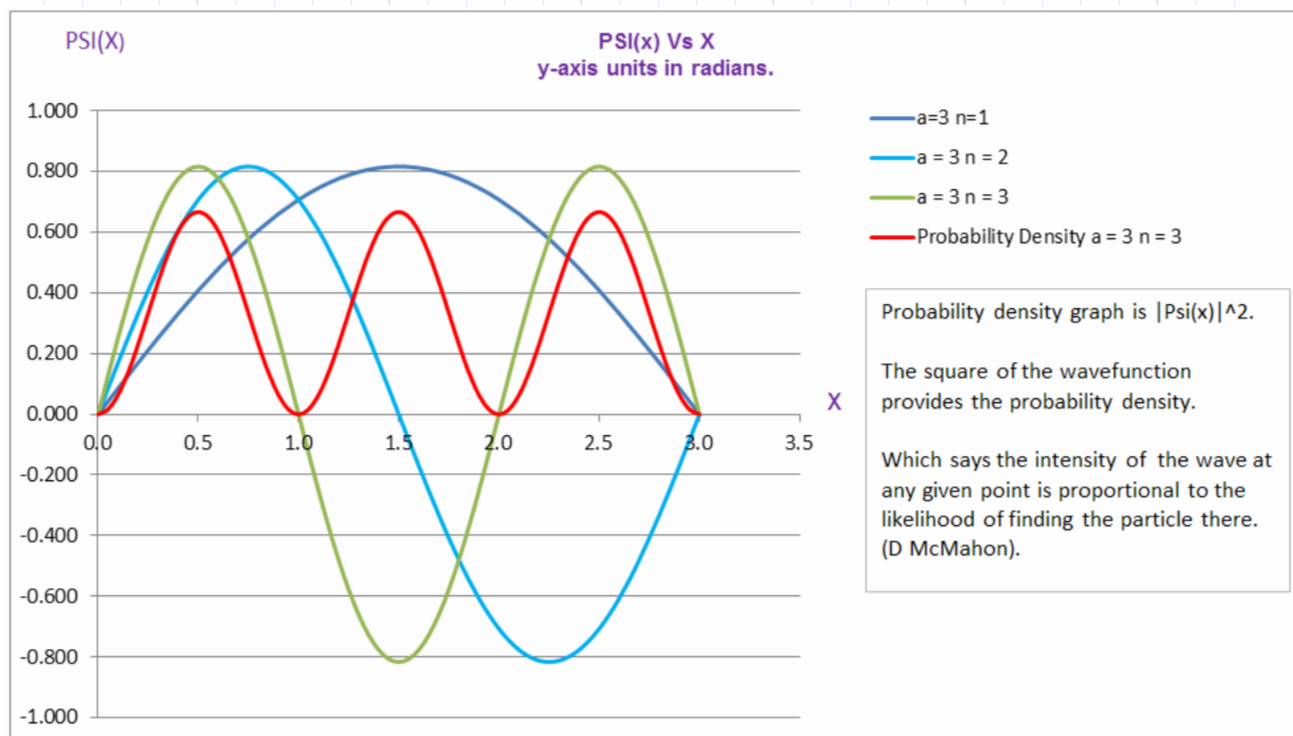

Graph of all 4 plots above.

Next page has the graph before the maximisation was conducted. Or in other words normalisation to the maximum value. Just so you get the reasoning behind how I managed to get these plots peaked to 1.

If you got a better way please send it on. The plots are similar to the plots D McMahon provided, of course he is correct. But 'the steps or how to' on how the plots were done on page 22-23 are not given.

Problem 6.6 (Aruldas QM Problems With Solution Textbook)

Consider the wave function

$$\Psi(x) := A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{(i \cdot k \cdot x)}$$

*Again same for the red rectangle ignore the rectangle, same elsewhere.*

a:=1 *By doing this, set a = 1, the software knows the variable a is assigned, it will not impact the solution here since we only use the text editor side of the software.*

$$\Psi(x) := A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{(i \cdot k \cdot x)}$$

*rewritten for clarity  $\Psi(x) = A e^{-x^2/a^2} e^{(i k x)}$*

Where A is a real constant.

- 1). Find the value of A ?
- 2). Calculate  $\langle p \rangle$  for this wave function?

**Solution:**

1).

First step here is to normalise the expression, multiply it by its conjugate.

$$\Psi_{conjugate}(x) := A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{(-i \cdot k \cdot x)}$$

negative sign in the 2nd exponential term

$$\Psi_{conjugate}(x) \cdot \Psi(x) := A^2 \cdot e^{\left(\frac{-2x^2}{a^2}\right)} = 1$$

exponential terms (ikx) results in  $e^0 = 1$ .

Next integrate the expression above shown below:

$$A^2 \cdot \int e^{\left(\frac{-2x^2}{a^2}\right)} dx = 1$$

$$1. \int_0^{\infty} \exp(-ax^2) dx = \frac{1}{2} \left(\frac{\pi}{a}\right)^{1/2}$$

<--- From table of exponential integrals.

$e^{\left(\frac{-2x^2}{a^2}\right)}$  in the form above, the constant term a:  $2/a^2$

$$A^2 \cdot \left(\frac{1}{2}\right) \cdot \left(\frac{\pi}{\frac{2}{a^2}}\right)^{1/2} = 1 \quad A^2 \cdot \left(\frac{\pi}{2}\right)^{1/2} = a \quad A := \left(\sqrt{\left(\frac{2}{\pi}\right)}\right) a \text{ Ans.}$$

*Please verify using your integral tables or manual calculation, that's the textbook answer.*

 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

2).

Momentum P Hamiltonian operator:  $i \cdot h' \nabla$

$\nabla$  <-- That is the Laplacian operator.

Sine we do not have it in this software in this edition we will use the up pointed triangle usually used for delta.

*Comment : This problem is the type you have the solution and so you work backward to make the question. Youre a scientist, engineer,... you know these things, you got the solution in mind, the math to show the reasoning-logic, so you work backward to generate the question. Nothing unusual about creating problems, the real world works like this too. This is NOT reverse eengineering thats something else.*

This is a one dimensional case so the expression is:  $\nabla = \left(\frac{h'}{i}\right) \cdot \frac{d}{dx}$

In this problem we use the 2nd form =  $(-i \cdot h') \cdot \frac{d}{dx}$

We work with the 'operator' working on the normalised expression.

With Schrodinger applying Normilisation technique is more the norm than exception.

One postulate for Schrodinger Equation is just that on Normalisation equal Unity.

$$\int_0^{\infty} \Psi - c \cdot \left( -i \cdot h' \cdot \left( \frac{d \Psi}{dx} \right) \right) dx$$

This is solution it requires setting up the integrals. We use expressions from the first part of the example problem in the solution.

$$\left( A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{i \cdot k \cdot x} \right) \cdot \left( -i \cdot h' \cdot \left( \frac{d \Psi}{dx} \right) \right)$$

First term

Second term

Start with the second term, the term to be differentiated:

$$\left( -i \cdot h' \cdot \left( \frac{d \Psi}{dx} \right) \right) = ?$$

$$\begin{aligned} \frac{d}{dx} \left( A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{i \cdot k \cdot x} \right) &= (-i \cdot h') \cdot A \cdot \left( \left( \frac{-2 \cdot x}{a^2} \right) \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{i \cdot k \cdot x} + e^{\left(\frac{-x^2}{a^2}\right)} \cdot (i \cdot k) \cdot e^{i \cdot k \cdot x} \right) \\ &= (-i \cdot h') \cdot A \cdot \left( e^{i \cdot j \cdot k} \cdot \left( \left( \frac{-2 \cdot x}{a^2} \right) \cdot e^{\left(\frac{-x^2}{a^2}\right)} + e^{\left(\frac{-x^2}{a^2}\right)} \cdot (i \cdot k) \right) \right) \end{aligned}$$

1). [Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.](#)  
 2). [To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.](#)  
 Purpose: [Quantum Mechanics for 'Power Plant Engineering' Studies.](#)  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Combining the terms:

$$\left( A \cdot e^{\left(\frac{-x^2}{a^2}\right)} \cdot e^{(-i \cdot k \cdot x)} \right) \cdot \left( (-i \cdot h') \cdot A \cdot (e^{i \cdot j \cdot k}) \cdot \left( \left( \frac{-2 \cdot x}{a^2} \right) \cdot e^{\left(\frac{-x^2}{a^2}\right)} + e^{\left(\frac{-x^2}{a^2}\right)} \cdot (i \cdot k) \right) \right)$$

Expand, evaluate, and place the integral sign:

$$(-i \cdot h') \cdot A^2 \cdot e^{\left(-2 \cdot \frac{x^2}{a^2}\right)} \cdot (1) \cdot \left(\frac{-2}{a^2}\right) \cdot (x) + (-i \cdot h') \cdot A^2 \cdot e^{\left(-2 \cdot \frac{x^2}{a^2}\right)} \cdot (i \cdot k)$$

Rearranging:

$$(-i \cdot h') \cdot \left(\frac{-2}{a^2}\right) \cdot A^2 \cdot \int_{-\infty}^{\infty} e^{\left(-2 \cdot \frac{x^2}{a^2}\right)} \cdot (x) dx + (-i \cdot h') \cdot (i \cdot k) \cdot A^2 \cdot \int_{-\infty}^{\infty} e^{\left(-2 \cdot \frac{x^2}{a^2}\right)} dx$$

The first integral term has an odd term  $x dx$ ,  $(x^1) dx$ , this integral vanishes from  $-\infty$  to  $+\infty$ . Check your college engineering mathematics textbook for intergration of exponential terms from  $-\infty$  to  $+\infty$ . Yet a good example with this difficulty on the odd term.

$$A^2 \cdot \int_{-\infty}^{\infty} e^{\left(\frac{-2x^2}{a^2}\right)} \cdot (x) dx = 1, \text{ leaving the right hand side term to:}$$

$$(-i \cdot h') \cdot (i \cdot k) = (-i^2) \cdot (h' \cdot k)$$

Therefore  $\langle p \rangle = h' \cdot k$  **Ans.**

**Comments:** Took almost a life time of some species to solve this. Reason for this was the expression below required to be corrected, there were 2 wave functions and the differential term so that totalled to 3 terms, INSTEAD of 1 conjugate wave function and the other the wave fuction to be differantated, which was 2 terms shown below.

$$\int_0^{\infty} \Psi - c \cdot \left( \hbar \cdot j \cdot h' \left( \frac{d \Psi}{dx} \right) \right) dx$$

**Advice:** Thousands of examples/problems can be given on QM Normalisation. There is **no end** to them. Here we got the general idea thru a few simple examples. Easy ones, sophisticated ones, oh beautiful/elegant ones, and very lengthy ones there are, so **there is NO point in going further.** No end to the beauty and elegance of mathematical expressions!

Brief Notes Very Relevant To QM Calculations.

From D. McMahon's textbook book, these topics are in chapter 2:

Definition: State collapse

Definition: Inner product

Definition: Calculating a coefficient of expansion

Definition: Meaning of the expansion coefficient

*Not difficult to understand, mostly math you have seen before.*

Thanks to his work in QM DeMYSTiFieD! The outcome of these topics helps place you in a much better position. Material Not found in most other QM books.

Stationary state:

When the potential V(x) is time independent a solution to the Schrodinger equation is:

$$\Psi(x, t) := \phi(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} \text{ ----- } \Phi(x) \text{ <-----}$$

We already know the space variable x in the function Phi(x) satisfies the time-independent Schrodinger equation.

LHS (x,t) = RHS (x) multiplied to e^(...t). But Phi itself as a function only has x as a variable. Two terms make up the RHS. The space part of the wave function Phi(x) satisfies Schrodinger's time independent potential V = V(x).

$$-\left(\frac{\hbar^2}{2m}\right) \left(\frac{d^2}{dx^2} \Phi(x)\right) + V(x) \cdot \Phi(x) = E \cdot \Phi(x)$$

E is the energy of the particle. The time independent Schrodinger equation.

A solution of Psi(x,t) = Phi(x) e^(-iEt/hbar) is called stationary because the probability density does not depend on time:

$$\psi(x, t) := \phi(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} \quad \text{<--- Solution written in this form for the Schrodinger equation is called a STATIONARY solution.}$$

Now progressing to stationary state

$$\psi(x, t) := \left(\phi(x) \cdot e^{\left(\frac{i \cdot E \cdot t}{\hbar}\right)}\right) \cdot \left(\phi(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} \#c\right) \quad \text{\#c 'instead of * for conjugate is written, software text editor issue.}$$

$$\psi(x, t) := (\phi(x) \#c) \cdot (\phi(x)) \cdot \left(e^{\left(\frac{i \cdot E \cdot t}{\hbar}\right)} \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} \cdot \#c\right)$$

$$\left(e^{\left(\frac{i \cdot E \cdot t}{\hbar}\right)} \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} \cdot \#c\right) = 1$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$\psi(x, t) := (\phi(x) \cdot e^{-iEt/\hbar})$  So, the function is spatial-space dependent and NOT time. Its called the stationary state. This seen in the previous example problems in the functions with variable x,  $\Psi(x)$ , when solving Schrodinger equation.

### Superposition of stationary states:

Consider the superposition of stationary states  $\Psi_1(x,t), \Psi_2(x,t), \dots, \Psi_n(x,t)$

$$\psi_1(x, t) \quad \psi_2(x, t) \quad \psi_3(x, t) \quad \psi_n(x, t)$$

Above states are solutions of the Schrodinger equation for a given potential  $V(x)$ . These stationary states can be written as:

$$\psi_n(x, t) := \phi_n(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)}$$

When can we combine the stationary states? At a given time, that is the same time for all of the states, could be any time, but that they are moving, NOT stationary, so it has to be at time  $t = 0$ ? No, a particle may come to rest at time(s) other than  $t=0$ , i.e. when its back to its ground state or non-excited state. Basically we are trying to say at  $t=0$  particle is stationary.

At time  $t = 0$  any wave function  $\Psi(x,0)$  can be written as a combination of these states:

$$\psi(x, 0) = \sum C_n \phi_n(x) \quad \text{OR written in full} \quad \sum C_n \phi_n(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)}$$

Really nothing special so far just adding them up, and that's called superposition BUT  $C_n$  is a coefficient! It needs solving. So example on this later should make clear.

From previous studies in QM or Physics:

$$v \text{ (freq)} = \omega / 2\pi$$

$$E = \hbar \omega / 2\pi \quad \text{where } \hbar / 2\pi = \hbar'$$

$$\mathbf{E} = \hbar' \omega$$

$$\text{therefore } \omega = \mathbf{E} / \hbar'$$

also  $p = \hbar' k$  where  $k$  is the wave vector.

Substitute  $\omega = E/\hbar'$  and in terms of summation  $\omega_n$

$$\psi(x, 0) = \sum C_n \phi_n(x) \quad \sum C_n \phi_n(x) \cdot e^{\left(\frac{-i \cdot E \cdot t}{\hbar}\right)} = \sum C_n \phi_n(x) \cdot e^{(-i \cdot \omega_n \cdot t)}$$

So we see any function  $\Psi(x,t)$  can be expanded, i.e. summation expression, in terms of  $\Phi_n$ . All the  $\Phi_n$ 's make up a set of basis functions.

$$\Psi \quad \text{--->} \quad \Phi_n$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Example a vector can be split into its x, y, and z components. You remember in the vector unit (i,j,k) so something like this sums up for the vector. NOT exactly the same here, similar. You got the general picture. When you have all the i j k or x y z for a vector in 3D space, you say the function is complete, here  $\Phi_n$  is complete.

State collapse: Applying superposition.

Given a function, at time t its at a certain state. Nothing new there thats the same for all function wrt to time. At a specific time in QM we may mean state as in energy level! So a little more specific here in this subject to energy level.

$$\Psi(x, t) = \sum C_n \Phi_n(x) \cdot e^{-i \cdot \omega_n \cdot t}$$

Lets say for the function above at a certain time when a measurement is made and the energy measured,  $E_i = h' \cdot \omega_i$ .

$$E_i := h' \cdot \omega_i$$

The state of the system, wrt to energy measured, takes on the state  $\Phi_i(x)$  at time of measurement or immediately after. *You may say dependent on system behaviour.*

$$\Psi(x, t) \xrightarrow{\text{measurement record}} \text{State of System } E_i \Phi_i(x)$$

We take another measurement i.e. a 2nd measurement right after the first measurement. The energy is found to be  $E = h' \omega_i$ . This time with certainty, and surely so, its the 2nd time, accuracy was a concern.

$$E_i := h' \cdot \omega_i$$

Both instances the expression is similar, with the subscript i identifying the i-th instance of the energy. Nothing new here.

$h'$  is the same.

$\omega_i$ ;  $\omega$  is the angular frequency and i-th instance is the i-th sequence of measurement of  $E_i$ .

Nothing to note so far, its like any other engineering function. With the system left alone, the wavefunction will spread out, as it should its an energy wave. It spread out as per expectation of the expression provided before shown here again with relevance to  $\omega_n$  in the exponential term:

$$\Psi(x, t) = \sum C_n \Phi_n(x) \cdot e^{-i \cdot \omega_n \cdot t}$$

As it spreads out, EXPANDS, it becomes a superposition of states. Key here is states in the phrase superposition of states. NOT superposition of wavefunctions. Got It!

To solve the expression above, we need to find  $C_n$ .

To do this we use the INNER PRODUCT. You seen this in Engineering Mathematics.

### Inner Product of 2 Wavefunctions.

2 wave functions shown below:

$$\Phi(x, t) \quad \Psi(x, t)$$

Their inner product (Phi, Psi):

$$(\Phi, \Psi) = \int \Phi_{conjugate}(x) \cdot \Psi(x) dx$$

Square the LHS:

$$(\Phi, \Psi)^2 = \left( \int \Phi_{conjugate}(x) \cdot \Psi(x) dx \right)^2$$

The result of the above square of (Phi, Psi) gives the probability that a measurement will find the system in state  $\Phi(x)$  given that it was originally in the state  $\Psi(x)$

*This does not mean anything until we see an example later. I don't see how you could understand it now no more than the next person who said so. Sure the meaning is like it was in one state and that operation got it to the next.*

Basis states are orthogonal. That is each pair of the basis are orthogonal, at right angles. At right angles the product of the 2 wave functions is 0, provided each basis is not the same as the other.

$$\int \Phi_{m-conjugate}(x) \cdot \Psi_n(x) dx = 0 \quad \text{Provided } m \text{ is NOT equal to } n.$$

Given the number of basis states and all were normalised  $\Phi_n(x)$   
 Then as above their product is orthonormal.

$$\int \Phi_{m-conjugate}(x) \cdot \Psi_n(x) dx = 0 \quad \begin{matrix} m \neq n \\ \text{if } m \text{ NOT equal to } n. \end{matrix}$$

and

$$\int \Phi_{m-conjugate}(x) \cdot \Psi_n(x) dx = 1 \quad \begin{matrix} m = n \\ \text{if } m \text{ NOT equal to } n. \end{matrix}$$

The orthonormal relationship can be expressed using the Kronecker delta function:

$$\delta_{mn} = \begin{matrix} 0 & \text{if } m \neq n \\ 1 & \text{if } m = n \end{matrix}$$

$$\text{Which is the same as: } \int \Phi_{m-conjugate}(x) \cdot \Psi_n(x) dx = \delta_{mn}$$

*Weldone ! Lets look at an example later.*

A vector is said to be normal if it has a length of one. Two vectors are said to be orthogonal if they are at right angles to each other (i.e. their dot product equal 0). A set of vectors is said to be orthonormal if they are all normal, and each pair of vectors in the set is said to be orthogonal. <---Please verify.

In linear algebra, two vectors in an inner product space are orthonormal if they are orthogonal and unit vectors. A set of vectors form an orthonormal set if all vectors in the set are mutually orthogonal and all of unit length. An orthonormal set which forms a basis is called an orthonormal basis. <---Please verify. Pulling out your math book and looking it up will help.

### Calculating a Coefficient of Expansion.

A state  $\psi(x, 0)$  is written as a sum of basis functions  $\phi_n(x)$   
 the nth coefficient of expansion  $C_n$  is found by computing the inner product of  
 $\phi_n(x)$  with  $\psi(x, 0)$  :

$$C_n = (\phi_n(x), \psi(x, 0)) = \int \phi_{n\_conjugate}(x) \cdot \psi(x, 0) dx \quad \leftarrow \text{RHS term}$$

*Note the variable  $t = 0$ , that is interpreted for a time independent Schrodinger equation. Here the spatial zone or area is of concern. Looks like it.*

$$\psi(x, 0) = \sum C_n \phi_n(x) \cdot e^{-i \cdot \omega_n \cdot 0} = \sum C_n \phi_n(x) \cdot (1) \quad \text{Looks like this.}$$

Because we have nth for the  $\psi_n(x)$  function, so the  $\psi(x, 0)$  function will have the mth term. Correct? n & m, where n not equal to m.

Lets continue now with the expansion of the RHS term.

$$\begin{aligned} \int \phi_{n\_conjugate}(x) \cdot \psi(x, 0) dx &= \int \phi_{n\_conjugate}(x) \cdot \left( \sum C_m \phi_m(x) \right) dx \\ &= \left( \sum C_m \right) \cdot \int \phi_{n\_conjugate}(x) \cdot \phi_m(x) dx \\ &= \left( \sum C_m \right) \cdot \int (\delta_{mn}) dx \\ &= \sum C_m (\delta_{mn}) \end{aligned}$$

$$= \sum C_m \delta_{mn} \quad \begin{array}{l} \delta_{mn} = 1 \text{ when } m = n, \text{ else } 0 \\ \delta_{mn} = 0 \text{ if } m \neq n \\ \delta_{mn} = 1 \text{ if } m = n \end{array}$$

which leaves the subscript of C be equal n.

All the subscripts, m & n, have to be the same for it to equal 1

$$= \sum C_n \delta_{nn} = \sum C_n (1) \quad \begin{array}{l} \text{summation of the one term,} \\ \text{the nth term is } C_n, \text{ not from} \\ \text{1 to } C_n, \text{ just } C_n \end{array}$$

$$= C_n$$

Emm...so a good example should make good on how to get that  $C_n$ .

**Comments:** Next just a minor addition to what we got thus far reaching to  $C_n$ . It is quite critical but you got some understanding of it already. If NOT the major critical side of QM...my say so as a non-physics. It is...what is the expectation of finding a particle or system given the space or region, the expectation in a probability sense. I may be correct!

1). [Main Textbook](#): QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

What is the expansion coefficient?

A state is written as  $\psi(x, t) = \sum C_n \phi_n(x) \cdot e^{-i \cdot \omega_n \cdot t}$

next the modulus squared of the expansion coefficient  $C_n$  becomes  
the probability of finding the system in state  $\phi_n(x)$

Probability of system is in state  $\phi_n(x) = |C_n|^2$

McMahon puts it in a very nice way, if a state  $\psi(x, t) = \sum C_n \phi_n(x) \cdot e^{-i \cdot \omega_n \cdot t}$   
and a 'measure of the energy is performed', what is the probability of finding  $E_n := h \cdot \omega_n$  ?

The answer is  $|C_n|^2$

Since the coefficients  $C_n$  represents probabilities, it must be true that:

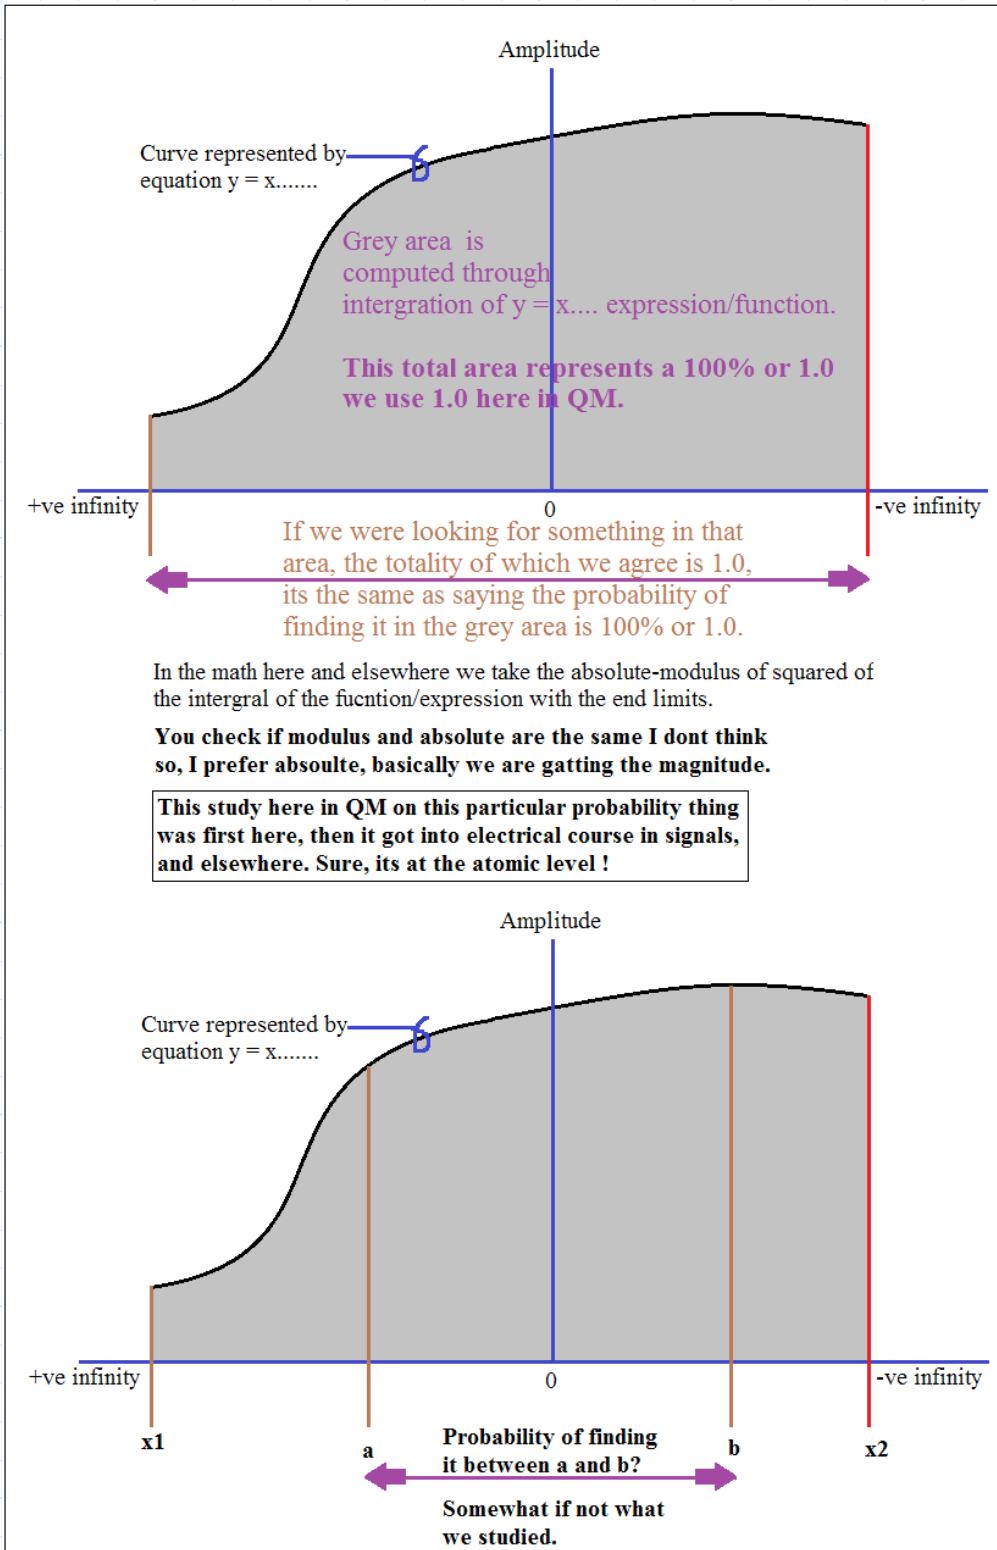

$$\sum |C_n|^2 = 1$$

End of the brief notes, next page a figure followed by corresponding examples.

*Comment: It will not surprise me if you find something wrong in the figure above, my idea, but it will surprise me if its reasonably okay and needing minor corrections!*

Problem 6.7 (Expansion of the wavefunction and fitting coefficients)  
QM DeMystified by D McMahon.

A particle of mass  $m$  is trapped in a one-dimensional box of width  $a$ .  
 The wavefunction is known to be:

$$\psi(x) := \left(\frac{i}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + \left(\sqrt{\frac{1}{a}}\right) \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right) - \left(\frac{1}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$$

If the energy is measured, what are the possible results and what is the probability of obtaining each result?  
 What is the most probable energy for this state?

**Solution:**

From the solutions of past 2 examples, we found a normalised wave function that fits the wavefunction above, and also found an expression for  $E_n$ . *This function needs to be adjusted, which is done later.*

Here

$$\Phi_n(x) := \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{n \cdot \pi \cdot x}{a}\right)$$

$$E_n := \frac{n^2 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a^2}$$

In the problem statement's equation the value of  $n$  in  $(n \pi x / a)$  are  $n = 1, 3,$  and  $4$ .  
 So we shall create a table for  $n = 1$  thru  $4$ .

$n$	$\Phi_n(x)$	$E_n$
1	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$	$\frac{h^2 \cdot \pi^2}{2 \cdot m \cdot a^2}$
2	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$	$\frac{4 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a^2}$
3	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right)$	$\frac{9 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a^2}$
4	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$	$\frac{16 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a^2}$

<--- The values of  $\Phi_n(x)$  in the table, each has  $(\text{Sqrt}(2/a))$  multiplied. These terms are not similar to the problem function expression. So we need to make fit so it does match. This by adjusting the wavefunction  $\Psi(x)$ .

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Multiply by  $\sqrt{\frac{2}{2}}$  each of the terms in the function, which you know  $\text{Sqrt}(2/2) = 1$ ,  
 and  
 it may only impact the concerned off middle term.

$$\psi(x) := \left(\frac{i}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + \left(\sqrt{\frac{2}{2}}\right) \left(\sqrt{\frac{1}{a}}\right) \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right) - \left(\frac{1}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$$

$$\psi(x) := \left(\frac{i}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + \left(\frac{1}{\sqrt{2}}\right) \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right) - \left(\frac{1}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$$

Let  $\Phi_n(x) := \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{n \cdot \pi \cdot x}{a}\right)$

$$\psi(x) := \left(\frac{i}{2}\right) \cdot \Phi_1(x) + \left(\frac{1}{\sqrt{2}}\right) \Phi_3(x) - \left(\frac{1}{2}\right) \cdot \Phi_4(x) \quad \text{Ignore the red rectangle}$$

Look over carefully the expression above.

We see a coefficients, (i/2) ..(sqrt(1/2)) ..-(1/2), in front of the Phi(x) function across the expression.

That would fit the coefficient of expansion idea we just studied:

$$\Psi(x) := \sum C_n \cdot \Phi_n(x) \quad \text{Ignore the red rectangle}$$

*Comment: McMahon creates an updated table to insert Cn....very enigneer like!*

*You can't complaint about D McMahon here.*

*Suggest you pick up his style of work or add to your existing, if youre not already doing it.*

n	C <sub>n</sub>	Φ <sub>n</sub> (x)	E <sub>n</sub>
1	$\frac{i}{2}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$	$\frac{h'^2 \cdot \pi}{2 \cdot m \cdot a^2}$
2	0	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$	$\frac{4 \cdot h'^2 \cdot \pi}{2 \cdot m \cdot a^2}$
3	$\frac{1}{\sqrt{2}}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right)$	$\frac{9 \cdot h'^2 \cdot \pi}{2 \cdot m \cdot a^2}$
4	$-\frac{1}{2}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$	$\frac{16 \cdot h'^2 \cdot \pi}{2 \cdot m \cdot a^2}$

<---Do you see a problem here?

C<sub>2</sub>: 0.

This tells us the energy at n=2 would be zero. Probability of finding anything here is? Zero.

We can live with that, its just that our mindset may been tune into a continous case of n =1 thru 4. That's all !

1). Answers to part 1.

Now proceed for the computation of the energy, and probability of measuring each energy; for  $n = 1, 3,$  and  $4.$

$$E_n := \frac{n \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a}$$

$n := 1$

**Note:**  $C_1$  is an imaginary number,  $i$ , so we take the conjugate for the square.

$$E_1 := \frac{1 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a} \quad \text{Ans} \quad P(E_1) := |C_1|^2 \cdot C_{1\_conj} \cdot C_1 = \left(\frac{-i}{2}\right) \cdot \left(\frac{i}{2}\right) = 0.25 \quad \text{Ans.}$$

$n := 3$  Real number of  $C_3$  so we just take the modulus square.

$$E_3 := \frac{3 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a} \quad \text{Ans} \quad P(E_1) := |C_3|^2 = \left(\frac{1}{\sqrt{2}}\right) \cdot \left(\frac{1}{\sqrt{2}}\right) = 0.5 \quad \text{Ans.}$$

$n := 4$

$$E_4 := \frac{4 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a} \quad \text{Ans} \quad P(E_1) := |C_4|^2 = \left(-\frac{1}{2}\right) \cdot \left(-\frac{1}{2}\right) = 0.25 \quad \text{Ans.}$$

All the probabilities are real number as should be.

2). Answers to part 2.

From the results above of the probabilities,  $n = 3$  has the highest probability at 50%. Hence, the probable energy for this state is  $E_3$

$$E_3 := \frac{9 \cdot h^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \quad \text{Ans.}$$

Comments:

This was a good example. The difficult part would be on the wavefunction's complexity. Getting the function set in a form that assists the steps for the solution of the coefficients, this would pose for me the tough part.

Non-Commercial Use Only

### Problem 6. 8 Dot Product & Energy of System after measurement.

A particle in a one-dimensional box ( $0 \leq x \leq a$ ) as in the state:

$$\psi(x) := \left(\frac{1}{\sqrt{10 \cdot a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + A \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right) + \left(\frac{3}{\sqrt{5 \cdot a}}\right) \cdot \sin\left(\frac{3 \pi \cdot x}{a}\right)$$

- 1). Find A so that  $\psi(x)$  is normalised.
- 2). What are the possible results of measurements of the energy, and what are the respective probabilities of obtaining each result?
- 3). The energy is measured and found to be  $(2 \pi^2 \hbar^2 / (ma^2))$ .  
What is the state of the system immediately after measurement?

**Solution:**

1).

The term in the function which is of concern in the middle term it has A:

$$A \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$$

$$\Phi_n := \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{n \cdot \pi \cdot x}{a}\right) \leftarrow \text{This term leads us to thru inspection to conclude it must be a basis function for a 1-dimensional box}$$

The inner products of the above term would be:

$$\Phi_m(x) \cdot \Phi_n(x) = \delta_{mn}$$

Make-adjust the wavefunction fit in such a way that each term has the coefficient:

$$\sqrt{\frac{2}{a}}$$

This is the coefficient in the middle term with A. Multiply by:  $\sqrt{\frac{2}{2}}$  which is 1 !

$$\psi(x) := \left(\sqrt{\frac{2}{2}}\right) \cdot \left(\frac{1}{\sqrt{10 \cdot a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + A \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right) + \left(\sqrt{\frac{2}{2}}\right) \cdot \left(\frac{3}{\sqrt{5 \cdot a}}\right) \cdot \sin\left(\frac{3 \pi \cdot x}{a}\right)$$

$$\psi(x) := \left(\sqrt{\frac{1}{20}}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + A \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right) + \left(\sqrt{\frac{3}{10}}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{3 \pi \cdot x}{a}\right)$$

Getting somewhere, so lets write the Phi(x) state:

$$\Phi_n(x) := \sin\left(\frac{n \cdot \pi \cdot x}{a}\right)$$

$$\psi(x) := \left(\sqrt{\frac{1}{20}}\right) \cdot \Phi_1(x) + A \cdot \Phi_2(x) + \left(\frac{3}{\sqrt{10}}\right) \cdot \Phi_3(x) \quad \text{We have it in a workable format.}$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Next applying the dot product.

Computing the inner product of  $(\psi(x), \psi(x))$ .

For the state to be normalised  $(\psi(x), \psi(x)) = 1$

Previous notes provided again below:

The orthonormal relationship can be expressed using the Kronecker delta function:

$$\delta_{mn} = \begin{cases} 0 & \text{if } m \neq n \\ 1 & \text{if } m = n \end{cases}$$

Drop m is NOT equal to n since this results in 0 as shown above.

$$(\psi(x), \psi(x)) =$$

$$\left( \left( \sqrt{\frac{1}{20}} \cdot \Phi_1(x) + A \cdot \Phi_2(x) + \left( \frac{3}{\sqrt{10}} \right) \cdot \Phi_3(x) \right), \left( \sqrt{\frac{1}{20}} \cdot \Phi_1(x) + A \cdot \Phi_2(x) + \left( \frac{3}{\sqrt{10}} \right) \cdot \Phi_3(x) \right) \right)$$

$$\left( \frac{1}{20} \right) \cdot (\Phi_1(x) \cdot \Phi_1(x)) + A^2 \cdot (\Phi_2(x) \cdot \Phi_2(x)) + \left( \frac{9}{10} \right) \cdot (\Phi_3(x) \cdot \Phi_3(x))$$

All the m and n subscripts are the same in each term above,  
 so according to the Kronecker delta function  $m=n$ , results in 1.  
 So these functions can be reduced to 1.

$$(\psi(x), \psi(x)) = \left( \frac{1}{20} \right) + A^2 + \left( \frac{9}{10} \right) = 1$$

$$\left( \frac{19}{20} \right) + A^2 = 1$$

$$A^2 = 1 - \left( \frac{19}{20} \right)$$

$$A^2 = \frac{1}{20}$$

$$A = \frac{1}{\sqrt{20}} \quad \text{Ans.}$$

The normalised wavefunction is:

$$\psi(x) := \left( \sqrt{\frac{1}{20}} \right) \cdot \Phi_1(x) + \left( \frac{1}{\sqrt{20}} \right) \cdot \Phi_2(x) + \left( \frac{3}{\sqrt{10}} \right) \cdot \Phi_3(x) \quad \text{Ans.}$$

Non-Commercial Use Only

2).

To determine the possible results of a measurement of the energy for a wavefunction expanded in basis states of the Hamiltonian, we look at each state in the expansion.

If the wavefunction is normalised, the squared modulus of the coefficient multiplying each state gives the probability of obtaining the given measurement. (D McMahon).

$$\psi(x) := \left(\sqrt{\frac{1}{20}}\right) \cdot \Phi_1(x) + \left(\frac{1}{\sqrt{20}}\right) \cdot \Phi_2(x) + \left(\frac{3}{\sqrt{10}}\right) \cdot \Phi_3(x)$$

State:  $\Phi_1(x)$

$$\text{Measurement\_of\_energy\_}E_1 := \frac{1^2 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2} \quad \text{Ans}$$

$$P(\text{Measurement\_of\_energy\_}E_1) := \left(\frac{1}{\sqrt{20}}\right)^2 = 0.05 \quad \text{Ans.}$$

State:  $\Phi_2(x)$

$$\text{Measurement\_of\_energy\_}E_2 := \frac{2^2 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2} = \frac{4 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2} \quad \text{Ans}$$

$$P(\text{Measurement\_of\_energy\_}E_2) := \left(\frac{1}{\sqrt{20}}\right)^2 = 0.05 \quad \text{Ans.}$$

State:  $\Phi_3(x)$

$$\text{Measurement\_of\_energy\_}E_3 := \frac{3^2 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2} = \frac{9 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2} \quad \text{Ans}$$

$$P(\text{Measurement\_of\_energy\_}E_3) := \left(\frac{3}{\sqrt{10}}\right)^2 = 0.9 \quad \text{Ans.}$$

State Energy\_Measurement Probability

$\Phi_1(x)$	$\frac{\pi^2 \cdot h^2}{2 \cdot m \cdot a^2}$	0.05
$\Phi_2(x)$	$\frac{4 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2}$	0.05
$\Phi_3(x)$	$\frac{9 \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2}$	0.90

Ans in Table format.

- 3). The energy is measured and found to be  $(2\pi^2 h^2 / (ma^2))$ .  
What is the state of the system immediately after measurement?

$$E_{\text{measured}} := \frac{2 \cdot \pi^2 \cdot h^2}{m \cdot a^2}$$

We need to form a new expression from the  $E_{\text{measured}}$  expression which is similar to the ones in the table in the previous page, and from it be able to associate a level of energy related to a state.

$$E_{\text{measured\_improved}} := \frac{(2^2) \cdot \pi^2 \cdot h^2}{2 \cdot m \cdot a^2}$$

From inspection of the above expression it can be determined  $n = 2$ .  
So we are looking at state number 2.

Earlier in the solution this was presented:

$$\Phi_n := \left( \sqrt{\frac{2}{a}} \right) \cdot \sin\left( \frac{n \cdot \pi \cdot x}{a} \right) \leftarrow \text{This term leads us to thru inspection to conclude it must be a basis function for a 1-dimensional box}$$

Therefore the state of the system immediately after measurement is:

$$\psi(x) = \Phi_2(x) := \left( \sqrt{\frac{2}{a}} \right) \cdot \sin\left( \frac{2 \cdot \pi \cdot x}{a} \right) \quad \text{Ans.}$$

### Notes:

Point form notes from pages 44-47 of QM Demystified.  
You can check in your QM OR Modern Physics textbook.

The phase of a wave function

- global phase
- relative phase
- local phase
- relative phase factor

Operators in QM

- operator
- expectation value or mean of an operator

If the action of an operator  $A$  on a function  $\Phi(x)$  is to multiply that function by some constant:

$$A \Phi(x) := \lambda \Phi(x)$$

we say that the constant  $\lambda$  is an eigenvalue of the operator  $A$ , and we call  $\Phi(x)$  an eigenfunction of  $A$ .

The momentum operator is given in terms of differentiation with respect to the position coordinate:

$$P_x \Psi(x) := -i \cdot \hbar \frac{d}{dx} \Psi(x)$$

The expectation value or mean of an operator  $A$  with respect to the wavefunction

$$\int_{-\infty}^{\infty} \Psi_{\text{conj}}(x) \cdot A \cdot \Psi(x) dx$$

Non-Commercial Use Only

### Example 6.9

A particle m in a one dimensional box. Box dimensions  $0 \leq x \leq a$ .

The particle is in the ground state.

Find  $\langle x \rangle$ , and  $\langle p \rangle$ ?

**Solution:**

Lets use the same wave function, the sinusoidal one, we have used in the past:

$$\psi(x) := \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$$

Theory for this solution OR the formulae:

$$|\Phi(x, t)|^2 = \psi^* \psi = \psi^* \psi = |\psi(x, t)|^2$$

Expected value of x  $\langle x \rangle$ :

$$\langle x \rangle = \int \psi^* \psi \cdot (x) \cdot \psi(x, t)$$

Expected value of p  $\langle p \rangle$ :

$$\langle p \rangle = \int \psi^* \psi \cdot (p) \cdot \psi(x, t)$$

$$\psi^* \psi \cdot \left(-i \cdot h \cdot \frac{d}{dx}\right) \cdot \psi(x, t)$$

In other words 'expectation value' is whats the probability of finding.

1). Find  $\langle x \rangle$ :

$$\langle x \rangle = \int_{-\infty}^{\infty} \left(\left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right)\right) \cdot (x) \cdot \left(\left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right)\right) dx$$

The conjugate term is the same because the sin(0 deg) is the same as sin(180 deg).... you verify, OR was it the cosine term? Cosine term 1 and -1. Again you verify.

$$\langle x \rangle = \int_{-\infty}^{\infty} \left(\left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right)\right) \cdot (x) \cdot \left(\left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right)\right) dx$$

Now the problem's limits are 0 and a. Place them instead of infinity (+,-).

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\begin{aligned}
 \langle x \rangle &= \psi_c^*(x, t) \cdot x \cdot \psi(x, t) = \int_0^a x \cdot \left( \left( \sqrt{\frac{2}{a}} \right) \sin\left(\frac{\pi \cdot x}{a}\right) \right)^2 dx \\
 &= \left(\frac{2}{a}\right) \cdot \int_0^a x \cdot \sin^2\left(\frac{\pi \cdot x}{a}\right) dx \\
 &= \left(\frac{2}{a}\right) \cdot \int_0^a x \cdot \left( \sin\left(\frac{\pi \cdot x}{a}\right) \right)^2 dx \\
 &= \left(\frac{2}{a}\right) \cdot \int_0^a x \cdot \left( \frac{1 - \cos\left(\frac{2 \cdot \pi \cdot x}{a}\right)}{2} \right) dx \quad \text{Trig substitution sort it out yourself.} \\
 &= \left(\frac{2}{a}\right) \cdot \int_0^a x dx - \left(\frac{1}{a}\right) \cdot \int_0^a x \cdot \left( \cos\left(\frac{2 \cdot \pi \cdot x}{a}\right) \right) dx \quad \text{Expanding the term, easy enough.}
 \end{aligned}$$

The 1st term is easily integrable, the 2nd needs integration by parts solution, which does require some effort. Method wise, one way for the by parts is first choose which is u make it the simpler expression, then work it out, seems difficult then switch 2nd term for u, then start over.

1st term:

$$\left(\frac{2}{a}\right) \cdot \int_0^a x dx = \left(\frac{2}{a}\right) \cdot \left(\frac{1}{2}\right) \cdot x^2 = \left(\frac{1}{a}\right) \cdot \frac{a^2}{2} - 0 = \frac{a}{2}$$

lim a - 0

2nd term:

$$\left(\frac{1}{a}\right) \cdot \int_0^a x \cdot \left( \cos\left(\frac{2 \cdot \pi \cdot x}{a}\right) \right) dx$$

Integration by parts:  $\int u dv = u \cdot v - \int v du$

$$\left(\frac{1}{a}\right) \cdot \int_0^a x \cdot \left( \cos\left(\frac{2 \cdot \pi \cdot x}{a}\right) \right) dx$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\text{Let } \frac{dy}{dx} = x \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$dy = x \cdot \cos \left( \frac{2 \pi \cdot x}{a} \right) dx$$

$$\text{Let } u = x$$

$$\frac{du}{dx} = 1$$

$$\text{so } du = dx$$

$$v = \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$\frac{dv}{dx} = \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$dv = \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

$$\int 1 dv = \int \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

$$v = \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$\int u dv = u \cdot v - \int v du$$

$$\int u dv = \int x \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

$$u \cdot v = x \cdot \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$\int v du = \int \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

Placing the terms in order:

$$\int x \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx = x \cdot \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) - \int \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

LHS is what the original expression to be intergrated.

$$\int x \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx = x \cdot \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) + \left( \frac{a}{2 \cdot \pi} \right) \left( \frac{a}{2 \cdot \pi} \right) \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$= \left( \frac{a}{2 \cdot \pi} \right) \cdot x \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) + \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

Applying the limits from a - 0:

a:

$$\left( \frac{a^2}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot a}{a} \right) \right) + \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot \left( \cos \left( \frac{2 \pi \cdot a}{a} \right) \right)$$

$$= \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot (\cos(2 \pi))$$

0:

$$\left( \frac{a}{2 \cdot \pi} \right) \cdot 0 \cdot \left( \sin \left( \frac{2 \pi \cdot 0}{a} \right) \right) + \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot \left( \cos \left( \frac{2 \pi \cdot 0}{a} \right) \right)$$

$$= \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot (\cos(0))$$

Putting it together:

$$\int x \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx = \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot (\cos(2 \cdot \pi) - (\cos(0)))$$

$$= \left( \frac{a^2}{4 \cdot \pi^2} \right) \cdot (1 - 1)$$

$$= 0$$

Continuing with the solution before stating the intergrations expression to solve below:

$$\langle x \rangle = \left( \frac{2}{a} \right) \cdot \int_0^a x dx - \left( \frac{1}{a} \right) \cdot \int_0^a x \cdot \left( \cos \left( \frac{2 \cdot \pi \cdot x}{a} \right) \right) dx$$

$$\langle x \rangle = \frac{a}{2} \quad \text{Ans.}$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Comments:

In the ground state, lowest energy, particle is found in half the height of the box.

Maybe since the particle is in ground state we would not expect to find it in the upper half of the box, its energy would be higher there than the lower half.

Its quite beautiful the math turns out the solution in a logical way. I may be wrong in my interpretation here, have been known too.

How do you argue that? Its a conspiracy as math was devised that way!!!! I've been defeated here in the past.

The width of the box was not considered here. Its a 1D, one dimensional box. That is its a straight line. 2 dimensional we have a rectangle. 3 dimensional we have a real box. Its some starting idea or learning for the simplest case. A box was shown in the figure above, since the example statement calls it a box, for this type of problems that may be usually how its expressed. You can't really say a line!

*We have a line and where is the particle found in the line! Sounds like a bad joke.*

2). Find  $\langle p \rangle$ :

$$\langle p \rangle = \int \psi^*(x, t) \cdot (p) \cdot \psi(x, t) dx$$

$$\int \psi^*(x, t) \cdot \left( -i \cdot \hbar \cdot \frac{d}{dx} \right) \cdot \psi(x, t) dx$$

(p) is a derivative operator.

We will face the same hurdle/obstacle/process of intergration here again.

Step by step let's attempt for a clear solution.

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\begin{aligned}
 \langle p \rangle &= \int_{-\infty}^{\infty} \psi^* \left( \frac{\partial}{\partial x} \right) \psi \, dx \\
 &= \int_{-\infty}^{\infty} \left( \sqrt{\frac{2}{a}} \sin\left(\frac{\pi x}{a}\right) \right)^* \cdot \left( -i \cdot \hbar \cdot \frac{d}{dx} \right) \cdot \left( \sqrt{\frac{2}{a}} \sin\left(\frac{\pi x}{a}\right) \right) dx \\
 &= \left( \frac{2}{a} \right) \cdot \int_{-\infty}^{\infty} \left( \sin\left(\frac{\pi x}{a}\right) \right)^* \cdot \left( -i \cdot \hbar \cdot \frac{d}{dx} \right) \cdot \left( \sin\left(\frac{\pi x}{a}\right) \right) dx \\
 &= \left( \frac{2}{a} \right) (-i \cdot \hbar) \cdot \int_{-\infty}^{\infty} \left( \sin\left(\frac{\pi x}{a}\right) \right)^* \cdot \frac{d}{dx} \left( \sin\left(\frac{\pi x}{a}\right) \right) dx \\
 &= (-i \cdot \hbar) \cdot \left( \frac{2}{a} \right) \cdot \left( \frac{\pi}{a} \right) \cdot \int_{-\infty}^{\infty} \left( \sin\left(\frac{\pi x}{a}\right) \right)^* \left( \cos\left(\frac{\pi x}{a}\right) \right) dx
 \end{aligned}$$

Integrating steps starting with the integration by parts:

$$\int_{-\infty}^{\infty} \left( \sin\left(\frac{\pi x}{a}\right) \right)^* \left( \cos\left(\frac{\pi x}{a}\right) \right) dx$$

$$\int u \, dv = u \cdot v - \int v \, du$$

$$u = \sin\left(\frac{\pi x}{a}\right) \quad \frac{du}{dx} = \left(\frac{\pi}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \quad du = \left(\frac{\pi}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \cdot dx$$

Look here with just u and du:

$$u \cdot du = \sin\left(\frac{\pi x}{a}\right) \cdot \left(\frac{\pi}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \cdot dx$$

$$u \cdot du = \left(\frac{\pi}{a}\right) \cdot \sin\left(\frac{\pi x}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \cdot dx$$

$$\left(\frac{a}{\pi}\right) \cdot \int u \, du = \sin\left(\frac{\pi x}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \cdot dx$$

So we don't have to go through the full parts method, since we got the expression on the RHS.

$$\int u \, du = \frac{u^2}{2} = \left(\frac{\pi}{2}\right) \cdot \left( \sin\left(\frac{\pi x}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) \right)^2 \quad \text{next the limits } a - 0.$$

$$a: \left(\frac{\pi}{2}\right) \cdot (\sin(\pi) \cdot \cos(\pi))^2 = 0$$

$$0: \left(\frac{\pi}{2}\right) \cdot (\sin(0) \cdot \cos(0))^2 = 0$$

$$\int u \, du = 0 - 0 = 0$$

$$\langle p \rangle = \int \psi^* \hat{p} \psi \, dx = 0 \quad \text{Ans.}$$

### Comments:

Given the one dimensional box, and the ground state of the particle. We are unable to obtain a momentum. This may be reasonable for this example because at ground state it may not have sufficient energy to move, fact wise it would not at ground state. Ok.

So the beauty of mathematics has shown the result correctly. <---No EXCLAMATION SYMBOL ! INSERTED HERE.

We had some idea maybe that the answer would be zero, since in ground state the particle would be somewhat if NOT stationary, you never can tell in science! Here the math proved elegantly there was no momentum.

The way  $x$  and  $p$  were acting in their respective expression's for position and momentum, is described as operators.

$X$  and  $P$  were operators in the expressions.

**Problem 6.10**

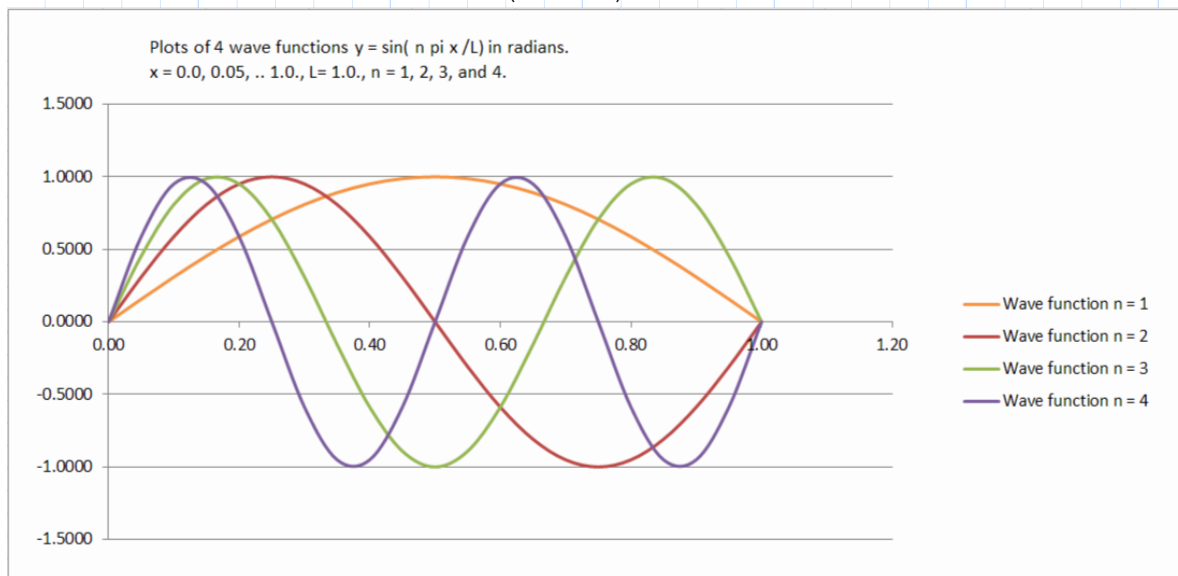

(Aruldhas QM Problems With Solution Textbook).

A particle constrained to move along the x-axis in the domain  $0 \leq x \leq L$  has a wave function  $\Psi(x) = \sin(n\pi x / L)$ , where n is an integer.

Normalise the wave function and evaluate the expectation value of its momentum.

**Solution:**

Wave function:  $\psi(x) := \sin\left(\frac{n \cdot \pi \cdot x}{L}\right)$  n is an integer.

The figure above shows 4 plots for  $n = 1, \dots, 4$ , with  $L = 1$ .  $N=4$  in comparison to  $n = 1$  shows there are 4 peaks, 2 pos and 2 neg, while  $n = 1$  shows one peak.  $n = 2$  shows one cycle. While  $n = 3$  shows 3 peaks, 2 pos 1 neg. So we have some understanding of the wave functions.

For the wave function to be normalised it must satisfy:

$$\int_0^L \left| A \cdot \sin\left(\frac{n \cdot \pi \cdot x}{L}\right) \right|^2 dx = 1$$

$$A^2 \cdot \int_0^L \sin^2 \cdot \left(\frac{n \cdot \pi \cdot x}{L}\right) dx = 1 \quad \text{Substitute trig identity for } \sin^2(n\pi x / L).$$

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$A^2 \cdot \int_0^L \left( \frac{1}{2} \right) \cdot \left( 1 - \cos \left( 2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \right) dx = 1$$

$$A^2 \cdot \left( \frac{1}{2} \right) \cdot \left( x - 2 \cdot \sin \left( 2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \right) = 1$$

Lim from L to 0

$$A^2 \cdot \left( \left( \frac{x}{2} \right) - \sin \left( 2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \right) = 1$$

Lim from L to 0

Lim L:

$$A^2 \cdot \left( \left( \frac{L}{2} \right) - \sin(2 \cdot (n \cdot \pi)) \right) = A^2 \cdot \left( \frac{L}{2} \right)$$

Lim 0:

$$A^2 \cdot \left( \left( \frac{0}{2} \right) - \sin(0) \right) = 0$$

Intergration results with A equal:

$$A^2 \cdot \left( \frac{L}{2} \right) = 1 \quad A^2 = \left( \frac{2}{L} \right) \quad A = \sqrt{\frac{2}{L}}$$

Now we update the wave function to a normalised wave function:

$$\psi(x) := \left( \sqrt{\frac{2}{L}} \right) \cdot \sin \left( \frac{n \cdot \pi \cdot x}{L} \right)$$

The normalised wave function plots are similar in shape with an increased amplitude of  $\sqrt{2}$ , with  $L = 1$ . If, there is anything wrong here you are welcome to improve it.

Now we calculate the expectation value of the momentum i.e.  $\langle p \rangle$ :

$$\begin{aligned} \langle p \rangle &= \psi^* \cdot (-i\hbar \frac{d}{dx}) \cdot \psi \\ &= \int_0^L \left( \left( \left( \frac{\sqrt{2}}{L} \right) \cdot \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \right) \cdot \left( -i \cdot \hbar \cdot \frac{d}{dx} \right) \cdot \left( \frac{\sqrt{2}}{L} \right) \cdot \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) dx \\ &= (-i \cdot \hbar) \cdot \left( \frac{2}{L} \right) \cdot \int_0^L \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \cdot \frac{d}{dx} \cdot \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) dx \\ &= (-i \cdot \hbar) \cdot \left( \frac{2}{L} \right) \cdot \left( \frac{n \cdot \pi}{L} \right) \cdot \int_0^L \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \cdot \left( \cos \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) dx \quad \text{Having differentiated the term.} \end{aligned}$$

Note: On the solution of the intergal of  $\sin(x)\cos(x)$  there are 3 possible solutions. Depending on the form of solution you seek for your requirements. Search online on Socratic.Org for all three solutions or other sites.

$$\begin{aligned} \text{Let } u &:= \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \\ \frac{d}{dx} \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) &= \left( \frac{n \cdot \pi}{L} \right) \cdot \cos \left( \frac{n \cdot \pi \cdot x}{L} \right) \\ du &= \left( \frac{n \cdot \pi}{L} \right) \cdot \cos \left( \frac{n \cdot \pi \cdot x}{L} \right) dx \quad \left( \left( \frac{L}{n \cdot \pi} \right) \right) \cdot du = \cos \left( \frac{n \cdot \pi \cdot x}{L} \right) dx \end{aligned}$$

Cancelling the  $\left( \frac{n \cdot \pi}{L} \right)$  term by having  $\left( \left( \frac{L}{n \cdot \pi} \right) \right)$  placed front of intergal

$$\begin{aligned} \left( \frac{L}{n \cdot \pi} \right) \cdot \int_0^L \left( \sin \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \cdot \left( \cos \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) dx &= \left( \frac{L}{n \cdot \pi} \right) \cdot \int u du \\ \left( \frac{L}{n \cdot \pi} \right) \cdot \int u du &= \left( \frac{L}{n \cdot \pi} \right) \cdot \frac{u^2}{2} + C = \left( \frac{L}{n \cdot \pi} \right) \cdot \left( \frac{1}{2} \right) \left( \sin^2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) + C \end{aligned}$$

$$\langle p \rangle = (-i \cdot \hbar) \cdot \left( \frac{2}{L} \right) \cdot \left( \frac{n \cdot \pi}{L} \right) \cdot \left( \left( \frac{L}{n \cdot \pi} \right) \right) \cdot \left( \frac{1}{2} \right) \left( \sin^2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) + C$$

$$\langle p \rangle = \left( \frac{-i \cdot \hbar}{L} \right) \cdot \left( \sin^2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) + C \quad \text{You check the intergration its different compared to Aruldhass solution, likely my error.}$$

Lim  $L \rightarrow 0$ .

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\langle p \rangle = \lim_{L \rightarrow 0} \left( -i \cdot \hbar \cdot \left( \frac{n \cdot \pi}{L^2} \right) \cdot \left( \sin^2 \cdot \left( \frac{n \cdot \pi \cdot x}{L} \right) \right) \right) + C \quad \text{<---Aruldas solution.}$$

We proceed with my error, assume I made an error.

$$\lim_{L \rightarrow 0} \left( \frac{-i \cdot \hbar}{L} \right) \cdot (\sin^2 \cdot (n \cdot \pi)) + C = C$$

$$\lim_{L \rightarrow 0} \left( \frac{-i \cdot \hbar}{L} \right) \cdot (\sin^2 \cdot (0)) + C = C$$

$$\lim_{L \rightarrow 0} C - C = 0 \quad \text{Correct. Same as Aruldas final answer.}$$

$$\langle p \rangle = 0 \quad \text{Ans. Expectation of the momentum is zero.}$$

**Comments:** It would had been suspicious if my answer was not zero as the solution presented by Aruldas was. I would probably had to resort to making Aruldas solution compatible.

Would this be a one dimensional box case?

Yes, since we have only one variable, i.e. variable x.

Key points/phrases from Demystified by D McMahon, before the next example.

You will need to check a QM or Modern Physics textbook for these.

- \* Phase factor
- \* Relative phase
- \* Global phase
- \* Local phase
- \* Operator
- \* Eigenvalue
- \* Eigenfunction
- \* Momentum operator
- \* Expectation value
- \* Hermitian operator
- \* Mean of the square of an operator
- \* Standard deviation OR Uncertainty in the operator - measures the spread of values about the mean of the operator.
- \* Hamiltonian operator

Page 29:

Three frequency seen intergrals we will use are:

$$\int_{-\infty}^{\infty} e^{-z^2} dz = \sqrt{\pi} \quad \text{<---- u for the next example}$$

$$\int_{-\infty}^{\infty} z^{2n} \cdot e^{-z^2} dz = \sqrt{\pi} \cdot \frac{(1 \cdot 3 \cdot 5 \cdot 7 \dots (2n-1))}{2^n} \quad n = 1, 2, 3, \dots \quad \text{<---- u form for the next example}$$

$$\int_{-\infty}^{\infty} z \cdot e^{-z^2} dz = 0 \quad \text{<---- Again, u for the next example}$$

Error function:

$$\text{erf}(z) := \frac{2}{\sqrt{\pi}} \cdot \int_0^z e^{-u^2} du$$

Next for the examples, hopefully illustrate their understanding, and use.

Continued next page.

Problem 6.11  
(Demystified D McMahon Textbook).

Let

$$\psi(x) := \left(\frac{2a}{\pi}\right)^{\frac{1}{4}} \cdot e^{(-a \cdot x^2)}$$

Assuming that u is real, find  $\langle x^n \rangle$  for arbitrary integers  $n > 0$ .

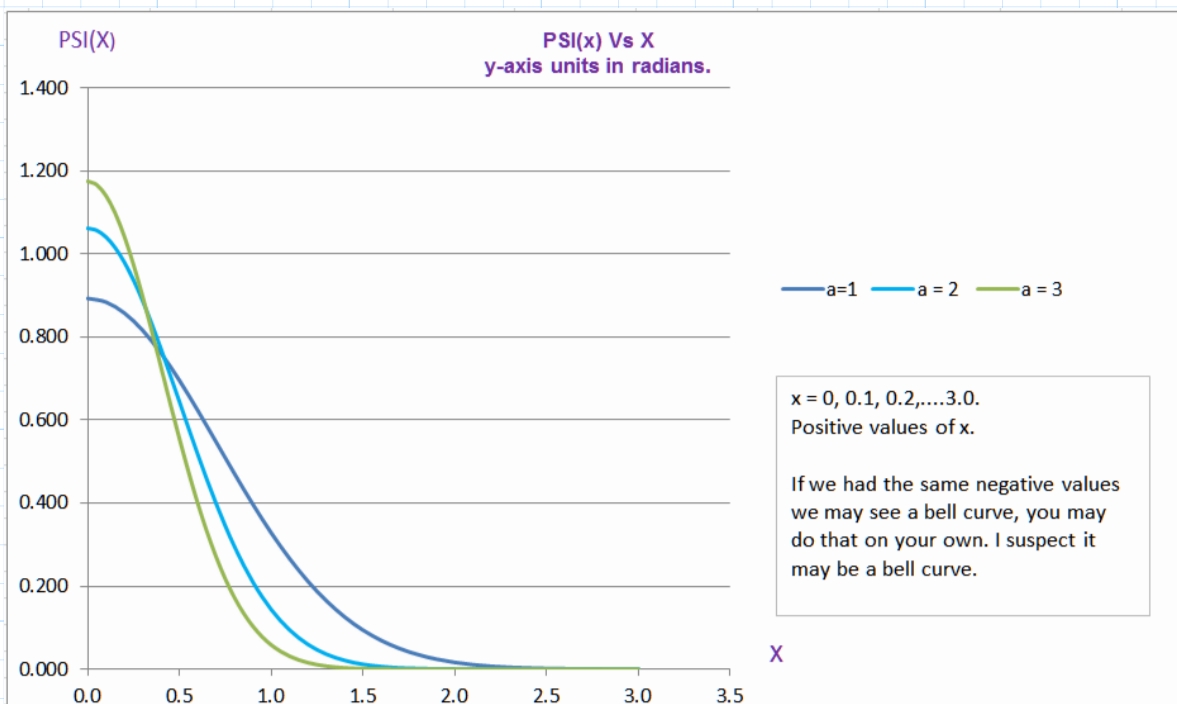

**Solution:**

The u in the problem statement see previous page later in solution.

Since  $\psi(x)$  is real, not complex, then the conjugate term would be the exact same.

$$\psi_{\text{conj}}(x) = \psi(x) := \left(\frac{2a}{\pi}\right)^{\frac{1}{4}} \cdot e^{(-a \cdot x^2)}$$

An attempt to plot the curve of the expression above. You may have a better idea of the correct curve. It seems a little unreal that we don't have an idea of the curve of the expression yet proceed to solve it for a subject like QM!  
 Again, I could be wrong.

1). [Main Textbook](#): QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: [Quantum Mechanics for 'Power Plant Engineering' Studies](#).  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Following the similar steps of previous example:

$$\begin{aligned}
 \langle x^n \rangle &= \int_{-\infty}^{\infty} \psi_{\text{conj}}(x) \cdot x^n \cdot \psi(x) dx \\
 &= \int_{-\infty}^{\infty} \left(\frac{2a}{\pi}\right)^{\frac{1}{4}} \cdot e^{(-a \cdot x^2)} \cdot x^n \cdot \left(\frac{2a}{\pi}\right)^{\frac{1}{4}} \cdot e^{(-a \cdot x^2)} dx \\
 &= \int_{-\infty}^{\infty} x^n \cdot \left(\frac{2a}{\pi}\right)^{\frac{1}{2}} \cdot e^{(-2 \cdot a \cdot x^2)} dx = \sqrt{\left(\frac{2a}{\pi}\right)} \cdot \int_{-\infty}^{\infty} x^n \cdot e^{(-2 \cdot a \cdot x^2)} dx
 \end{aligned}$$

Let

$$z^2 = 2 \cdot a \cdot x^2$$

$$z = \sqrt{2 \cdot a \cdot x^2} = \sqrt{2 \cdot a} \cdot x$$

$$\frac{d}{dx} \sqrt{2 \cdot a} \cdot x = \sqrt{2 \cdot a} \quad dx := \frac{dz}{\sqrt{2 \cdot a}} \quad dz := \sqrt{2 \cdot a} \cdot dx$$

Rearranging the integral to match the terms above:

$$\langle x^n \rangle = \sqrt{\left(\frac{2a}{\pi}\right)} \cdot \int_{-\infty}^{\infty} x^n \cdot e^{(-2 \cdot a \cdot x^2)} dz \cdot \frac{1}{\sqrt{2 \cdot a}} = \sqrt{\left(\frac{1}{\pi}\right)} \cdot \int_{-\infty}^{\infty} x^n \cdot e^{(-2 \cdot a \cdot x^2)} dz$$

A little more on the substitution:

$$dx := \frac{dz}{\sqrt{2 \cdot a}} \quad \int 1 dx = \int \frac{1}{\sqrt{2 \cdot a}} dz$$

$$x = \frac{z}{\sqrt{2 \cdot a}}$$

$$\text{Then } x^n = \left(\frac{z}{\sqrt{2 \cdot a}}\right)^n$$

$$\langle x^n \rangle = \frac{1}{\sqrt{\pi}} \cdot \int_{-\infty}^{\infty} \left(\frac{z}{\sqrt{2 \cdot a}}\right)^n \cdot e^{(-z^2)} dz \quad \leftarrow \text{Some resemblance of the u mentioned in the brief notes.}$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Rearrange again:

$$\langle x^n \rangle = \frac{1}{\sqrt{\pi}} \cdot \left( \frac{1}{\sqrt{2 \cdot a}} \right)^n \cdot \int_{-\infty}^{\infty} (z)^n \cdot e^{(-z^2)} dz$$

Expression above, right most intergral, matches the expression below provided in the brief point form notes:

$$\int_{-\infty}^{\infty} z^{2n} \cdot e^{-z^2} dz = \sqrt{\pi} \cdot \frac{(1 \cdot 3 \cdot 5 \cdot 7 \dots (2n-1))}{2^n} \quad n = 1, 2, 3, \dots$$

Our expression after substitution becomes:

$$\langle x^n \rangle = \frac{1}{\sqrt{\pi}} \cdot \left( \frac{1}{\sqrt{2 \cdot a}} \right)^n \cdot \left( \sqrt{\pi} \cdot \frac{(1 \cdot 3 \cdot 5 \cdot 7 \dots (2n-1))}{2^n} \right)$$

$$\langle x^n \rangle = \left( \frac{1}{\sqrt{2 \cdot a}} \right)^n \cdot \left( \frac{(1 \cdot 3 \cdot 5 \cdot 7 \dots (2n-1))}{2^n} \right) \quad \text{Ans. For even values of n.}$$

For odd values of n,  $\langle x^n \rangle = 0$ .

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

### Example 6.12

$$\psi(x) := A \cdot x \cdot e^{ax} \quad \text{for} \quad 0 \leq x \leq a$$

Normalise the wave function and solve for A?

### Solution:

The wave function is real. Not a complex expression (a + ib).

So the form of normalisation is:

$$\int_0^a \psi(x) \cdot \psi(x) dx = \int_0^a (A \cdot x \cdot e^{ax})^2 dx = 1$$

$$= A^2 \cdot \int_0^a (x^2 \cdot e^{2 \cdot ax}) dx = 1$$

Let  $u = x^2$

$$\frac{du}{dx} = 2 \cdot x \quad du = 2 \cdot x \cdot dx$$

Let  $dv = e^{2ax} dx$

$$\int 1 dv = \int e^{2ax} dx$$

$$v = \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x})$$

Integration by parts:  $\int u dv = u \cdot v - \int v du$

$$\int x^2 \cdot e^{2ax} dx = x^2 \cdot \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) - \int \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) \cdot 2 \cdot x dx \quad \dots \text{Eq 6.12-1}$$

Do another integration by parts on the right most integral

$$\frac{1}{a} \cdot \int x \cdot (e^{2 \cdot a \cdot x}) dx$$

Let  $u = x \quad \frac{du}{dx} = 1 \quad du = dx$

$dv := e^{2 \cdot a \cdot x}$

$$\int 1 dv = \int e^{2 \cdot a \cdot x} dx$$

$$v = \left( \frac{1}{2 \cdot a} \right) \cdot e^{2 \cdot a \cdot x}$$

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\int u dv = u \cdot v - \int v du \quad \text{Substitute in:}$$

$$\int x \cdot e^{2 \cdot a \cdot x} dx = x \cdot \left( \frac{1}{2 \cdot a} \right) \cdot e^{2 \cdot a \cdot x} - \int \left( \left( \frac{1}{2 \cdot a} \right) \cdot e^{2 \cdot a \cdot x} \right) dx$$

The right most term is intergrable which becomes:

$$\int x \cdot e^{2 \cdot a \cdot x} dx = x \cdot \left( \frac{1}{2 \cdot a} \right) \cdot e^{2 \cdot a \cdot x} - \left( \frac{1}{4 \cdot a^2} \right) \cdot e^{2 \cdot a \cdot x}$$

Substitute into expression 6.12-1 on previous page.

$$\int x^2 \cdot e^{2ax} dx = x^2 \cdot \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) - \int \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) \cdot 2 \cdot x dx \quad \dots \text{Eq 6.12-1}$$

$$\int x^2 \cdot e^{2ax} dx = x^2 \cdot \frac{1}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) - \frac{1}{2 \cdot a} \cdot \left( x \cdot \left( \frac{1}{2 \cdot a} \right) \cdot e^{2 \cdot a \cdot x} - \left( \frac{1}{4 \cdot a^2} \right) \cdot e^{2 \cdot a \cdot x} \right)$$

$$\int x^2 \cdot e^{2ax} dx = \frac{x^2}{2 \cdot a} \cdot (e^{2 \cdot a \cdot x}) - \frac{x}{4 \cdot a^2} \cdot e^{2 \cdot a \cdot x} + \left( \frac{1}{8 \cdot a^3} \right) \cdot e^{2 \cdot a \cdot x}$$

If this is agreeable, you check it, we re-arrange the expression next:

$$\int x^2 \cdot e^{2ax} dx = \left( \frac{x^2}{2 \cdot a} \cdot e^{2 \cdot a \cdot x} \right) - \frac{x}{4 \cdot a^2} \cdot (e^{2 \cdot a \cdot x}) + \left( \frac{1}{8 \cdot a^3} \right) \cdot e^{2 \cdot a \cdot x}$$

We started here so what we have is:

$$\int_0^a \psi(x)^2 dx = \int (A \cdot x \cdot e^{ax})^2 dx = 1$$

$$= A^2 \cdot \int (x^2 \cdot e^{2 \cdot a \cdot x}) dx$$

$$\int_0^a \psi(x)^2 dx = A^2 \cdot \left( \left( \frac{x^2}{2 \cdot a} \cdot e^{2 \cdot a \cdot x} \right) - \frac{x}{4 \cdot a^2} \cdot (e^{2 \cdot a \cdot x}) + \left( \frac{1}{8 \cdot a^3} \right) \cdot e^{2 \cdot a \cdot x} \right) = 1$$

Apply the limits a thru 0

Lim a:

$$\left( \left( \frac{a}{2} \cdot e^{2 \cdot a \cdot a} \right) - \frac{1}{4 \cdot a} \cdot (e^{2 \cdot a \cdot a}) + \left( \frac{1}{8 \cdot a^3} \right) \cdot e^{2 \cdot a \cdot a} \right)$$

Lim 0:

$$\left( \frac{1}{8 \cdot a^3} \right)$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\int_0^a \psi(x)^2 dx = A^2 \left( \left( \frac{a}{2} \cdot e^{2 \cdot a^2} \right) - \frac{1}{4 \cdot a} \cdot (e^{2 \cdot a^2}) + \left( \frac{1}{8 \cdot a^3} \right) \cdot e^{2 \cdot a^2} - \left( \frac{1}{8 \cdot a^3} \right) \right) = 1$$

$$\int_0^a \psi(x)^2 dx = A^2 (e^{2 \cdot a^2}) \left( \frac{a}{2} - \frac{1}{4 \cdot a} + \left( \frac{1}{8 \cdot a^3} \right) \right) - A^2 \cdot \left( \frac{1}{8 \cdot a^3} \right) = 1$$

$$A^2 = \frac{1}{(e^{2 \cdot a^2}) \left( \frac{a}{2} - \frac{1}{4 \cdot a} + \left( \frac{1}{8 \cdot a^3} \right) \right) - \left( \frac{1}{8 \cdot a^3} \right)}$$

$$A = \sqrt{\frac{1}{(e^{2 \cdot a^2}) \left( \frac{a}{2} - \frac{1}{4 \cdot a} + \left( \frac{1}{8 \cdot a^3} \right) \right) - \left( \frac{1}{8 \cdot a^3} \right)}} \quad \text{Ans. Check through for errors.}$$

Comments:

This was long in comparison to pervious examples. So we leave it here for just the normalisation. For real world applications the wave function has to fit a real world application, not just an expression thats intergrable, this would mean for example a wavefunction when plotted has a simple recognisable period not one that is lengthy and complex. Check thru for errors. This example was not from the referenced books.

In these examples its easier to use 'a' for the upper limit because if it were in QM perspective we would have such small dimensions for the upper limit and evaluating the expression would be a burden. So we just leave it as 'a'.

Notes from page 50 of QM Demystified by D McMahon:

If a normalised wavefunction is expanded in a basis with known expansion coefficients, we can use this expansion to calculate mean values.

Specifically, if a wavefunction has been expanded as:

$$\psi(x, 0) = \sum c_n \phi_n(x)$$

where the basis functions  $\phi_n(x)$  are eigenfunctions of operator A with eigenvalues  $a_n$  then the mean of operator A can be found from:

$$\langle A \rangle = \sum a_n \cdot |c_n|^2$$

What is a Hermitian operator?

If the following relationship holds:

$$\int \phi_{\text{conj}}(x) \cdot [A \cdot \psi(x)] dx = \int \psi(x) \cdot (A^{\text{conj}} \cdot \phi^{\text{conj}}(x)) dx$$

Observe carefully how the operator and the functions are positioned.  
 Any error? Check your textbook.

When this holds we say operator A is Hermitian.

Hermitian operators which have real eigenvalues are fundamentally important in QM.

Quantities which can be measured experimentally, like energy or momentum, are represented by Hermitian operators.

*Atomic Physics by SN ghosal has adequate material on Hermitian, this includes Hermitian properties. Its a topic by itself on the subject of Hermitian, mathematics in nature. So a little frown maybe there, certainly is with me.*

How to calculate the mean of the square of an operator:

$$\langle A^2 \rangle = \int_{-\infty}^{\infty} \psi_{\text{conj}}(x) \cdot A^2 \cdot \psi(x) dx$$

Where  $\langle A^2 \rangle$  is the operator (A)(A).

This then leads to the quantity known as standard deviation or uncertainty in A:

$$\Delta A = \text{Sqrt}(\langle A^2 \rangle - \langle A \rangle^2)$$

this quantity measures the spread of values about the mean for A.

Next example will make it clearer on the use of the above expressions.

Non-Commercial Use Only

### Example 6.13 Uncertainty In A.

$$\psi(x) := A(a \cdot x - x^2) \quad \text{For } 0 \leq x \leq a$$

- a). Normalise the wave function  
 b). Find  $\langle x \rangle$ ,  $\langle x^2 \rangle$  and uncertainty  $\Delta(x)$

#### Solution:

We see the wave function is real.

a).

$$\begin{aligned} \int \psi^2 dx &= \int_0^a A^2 \cdot (ax - x^2)^2 dx \\ &= \int_0^a A^2 \cdot (a^2 x^2 - 2ax^3 + x^4) dx \\ &= A^2 \cdot \left( \frac{1}{3} a^2 x^3 - \frac{1}{2} a x^4 + \frac{1}{5} x^5 \right) \end{aligned}$$

Lim a - 0:

$$A^2 \cdot \left( \frac{1}{3} a^5 - \frac{1}{2} a^5 + \frac{1}{5} a^5 \right) - 0 = 1 \quad A^2 \cdot a^5 \cdot \left( \frac{10 - 15 + 6}{30} \right) = 1$$

$$A^2 \cdot a^5 \cdot \left( \frac{1}{30} \right) = 1 \quad A^2 = \frac{30}{a^5} \quad A := \sqrt{\frac{30}{a^5}}$$

Next we substitute  $A^2$  in the intergral expression to solve for uncertainty in A.

*Discussion:* We have a photon its behaviour is described by the expression above, lets say thats how it strikes/hits the photovoltaic cell in a solar panel. So would calculating the uncertainty describe the spread of success in making the photon strike a electron and creating an electron flow?  $\langle x \rangle$  means the expectation of x, and  $\langle x^2 \rangle$  another expected value, then we get the uncertainty of A. From previous examples we saw in a table format the probability was equal to  $A^2$ .

You got a better way of applying-explaining this example put it forward.

b).

$$\begin{aligned} \langle x \rangle &= \int x \cdot \psi^2 dx = \int_0^a A^2 \cdot x^2 \cdot (ax - x^2)^2 dx = 1 \\ &= A^2 \cdot \int_0^a (a^2 x^3 - 2ax^4 + x^5) dx = A^2 \cdot \left( a^2 \frac{x^4}{4} - 2a \frac{x^5}{5} + \frac{x^6}{6} \right) \end{aligned}$$

Lim a - 0

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.

Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.

Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\langle x \rangle = \frac{30}{a^5} \cdot \left( a^2 \frac{x^4}{4} - 2a \frac{x^5}{5} + \frac{x^6}{6} \right)$$

Lim  $a \rightarrow 0$

$$\langle x \rangle = \frac{a}{2} \quad \text{Ans.}$$

Next for  $\langle x^2 \rangle$ :

$$\langle x^2 \rangle = \int_0^a x^2 \cdot \psi^2 dx = \int_0^a A^2 \cdot x^4 \cdot (ax - x^2)^2 dx = 1$$

$$= A^2 \cdot \int_0^a x^4 \cdot (a^2 x^2 - 2ax^3 + x^4) dx = A^2 \cdot \int_0^a (a^2 x^4 - 2ax^5 + x^6) dx$$

$$= \frac{30}{a^5} \cdot \left( a^2 \frac{x^5}{5} - 2a \frac{x^6}{6} + \frac{x^7}{7} \right)$$

Lim  $a \rightarrow 0$

$$\langle x^2 \rangle = \frac{2a^2}{7} \quad \text{Ans.}$$

Next calculate the uncertainty:

$$\Delta x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$$

$$\Delta x = \sqrt{\left( \frac{2a^2}{7} \right) - \left( \frac{a}{2} \right)^2} = \sqrt{\frac{8a^2 - 7a^2}{28}} = \sqrt{\frac{a^2}{28}}$$

$$\Delta x = \frac{a}{\sqrt{28}} \quad \text{Ans.}$$

Discussion:

So uncertainty calculated here is  $a/\sqrt{28}$ . A one dimensional box,  $x$  from 0 to  $a$ , expected value or probability of finding the particle within this range were earlier examples, here its the uncertainty of the expected value or its spread for the given limits of that expected value of  $x$ .

Notes: Hamiltonian operator.

One dimensional Hamiltonian operator H:

$p_x$  = momentum of particle in x-direction

$$H := \left(\frac{1}{2m}\right) \cdot (p_x^2) + V(x) = \left(\frac{1}{2m}\right) \left(\frac{h}{i} \cdot \frac{d}{dx}\right)^2 + V(x) = -\left(\frac{h^2}{2m}\right) \left(\frac{d^2}{dx^2}\right) + V(x)$$

...page 248 SN Ghosal (Atomic Physics-Modern Physics).

$$H = -\left(\frac{h^2}{2m}\right) \left(\frac{d^2}{dx^2}\right) + V(x, t) = \frac{P^2}{2m} + V(x, t)$$

Acting the Hamiltonian operator on a wave function

$$H \cdot \psi(x, t) = ih \cdot \frac{d \psi(x, t)}{dt} \quad \text{time dependent .....McMahon}$$

Time independent Hamiltonian operator one dimensional:

$$-\left(\frac{h^2}{2m}\right) \left(\frac{d^2}{dx^2}\right) \cdot \psi(x) = E \cdot \psi(x) \quad \text{where E is the energy.}$$

...page 253 SN Ghosal (Atomic Physics-Modern Physics).

$$H \cdot \psi(x, t) = E \cdot \psi(x) \quad \text{time dependent (eigenvalues).....McMahon}$$

E above in McMahon page 52: The eigenvalues E of the Hamiltonian are the energies of the system. Or you can say the allowed energies of the system are the eigenvalues of the Hamiltonian operator H.

The [average or mean energy of a system](#) expanded in the basis states  $\phi_n$  is found from:

$$\langle H \rangle = \sum E_n \cdot |c_n|^2 = \sum E_n \cdot P_n \quad \text{Pn is the probability the energy is measured.}$$

**Note:** For  $E_n$  do NOT take the 'squared of n' instead 'n' only. As shown in example.

$$E_n := \frac{n \pi^2 h^2}{2 m \cdot a^2}$$

Review example 6.7 where each state number's energy was calculated. Now for the mean energy apply the expression above. Next example use's this expression.

Non-Commercial Use Only

Example 6.13 Mean Energy of a System (D McMahon).

In example 6.7, the following state for a particle trapped in a one-dimensional box was considered:

$$\psi(x) := \left(\frac{i}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) + \left(\sqrt{\frac{1}{a}}\right) \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right) - \left(\frac{1}{2}\right) \cdot \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$$

What is the mean energy for this system?

**Solution:**

The following results were obtained in example 6.7:

n	C <sub>n</sub>	Φ <sub>n</sub> (x)	E <sub>n</sub>	E <sub>n</sub> := $\frac{n^2 \pi^2 h^2}{2 m \cdot a^2}$
1	$\frac{i}{2}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$	$\frac{h^2 \cdot \pi}{2 \cdot m \cdot a^2}$	
2	0	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)$	$\frac{4 \cdot h^2 \cdot \pi}{2 \cdot m \cdot a^2}$	
3	$\frac{1}{\sqrt{2}}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{3 \cdot \pi \cdot x}{a}\right)$	$\frac{9 \cdot h^2 \cdot \pi}{2 \cdot m \cdot a^2}$	
4	$-\frac{1}{2}$	$\sqrt{\frac{2}{a}} \cdot \sin\left(\frac{4 \cdot \pi \cdot x}{a}\right)$	$\frac{16 \cdot h^2 \cdot \pi}{2 \cdot m \cdot a^2}$	

Probabilities calculated:

$$P(E_1) := |C_1|^2 \quad C_{1\_conj} \cdot C_1 = \left(\frac{-i}{2}\right) \cdot \left(\frac{i}{2}\right) = 0.25 \quad \text{OR} = 1/4$$

$$P(E_2) := |C_2|^2 \quad (0) \cdot (0) = 0$$

$$P(E_3) := |C_3|^2 = \left(\frac{1}{\sqrt{2}}\right) \cdot \left(\frac{1}{\sqrt{2}}\right) = 0.5 \quad \text{OR} = 1/2$$

$$P(E_4) := |C_4|^2 = \left(-\frac{1}{2}\right) \cdot \left(-\frac{1}{2}\right) = 0.25 \quad \text{OR} = 1/4$$

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

The average or mean energy of a system expanded in the basis states  $\phi_n$  is found from:

$$\langle H \rangle = \sum E_n \cdot |c_n|^2 = \sum E_n \cdot P_n$$

$$E_n := \frac{n^2 \pi^2 \hbar^2}{2 m \cdot a^2} \quad \text{and the probabilities } P_n \text{ were calculated.}$$

The **subscript n in  $E_n$**  indicates the basis state number, it need must **not be squared** further for the summation of the mean energy.

$$\langle H \rangle : \frac{1 \hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \cdot \left(\frac{1}{4}\right) + \frac{2 \hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} (0) + \frac{3 \hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \left(\frac{1}{2}\right) + \frac{4 \hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \left(\frac{1}{4}\right)$$

$$\langle H \rangle : \frac{1 \hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \cdot \left(\frac{1}{4}\right) + \frac{\hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \left(\frac{3}{2}\right) + \frac{\hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \left(\frac{4}{4}\right)$$

$$\langle H \rangle : \frac{\hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \cdot \left(\frac{1}{4} + \frac{3}{2} + \frac{4}{4}\right) = \frac{\hbar^2 \cdot \pi^2}{2 \cdot m \cdot a^2} \cdot \left(\frac{11}{4}\right)$$

$$\langle H \rangle = \left(\frac{11}{8}\right) \frac{\hbar^2 \cdot \pi^2}{m \cdot a^2} \quad \text{Ans.}$$

McMahon said in the textbook, page 53, the mean energy would never actually be measured for the system. Here we performed it's calculation based on each state's probability.

Non-Commercial Use Only

Example 6.14 SN Ghosal Chapter 10 page 267.

We can easily prove the Hermitian character of the operators representing some of the dynamical variables, eg., the angular momentum, linear momentum, etc.

The z component of the **orbital angular momentum**,  $L_z$ , has the following operator representation

$$L_z := -i \cdot h' \cdot \left( \frac{d}{d\phi} \right) \quad \leftarrow \text{---The operator}$$

where  $\phi$  is the azimuthal angle.

$f(xyz)$  and  $g(xyz)$  are two functions, then

$$\begin{aligned} \int_0^{2\pi} f^{\text{conj}}(z) L_z \cdot g(z) d\phi &= \int_0^{2\pi} f^{\text{conj}}(z) \cdot \left( -i \cdot h' \cdot \frac{d}{d\phi} \right) \cdot g(z) d\phi \\ &= (-i \cdot h') \cdot \int_0^{2\pi} f^{\text{conj}}(z) \cdot -i \cdot h' \cdot \left( \frac{d}{d\phi} \right) \cdot g(z) d\phi \end{aligned}$$

We leave out the z component in the function, makes it easier to read. Its the same if it were in the x or y component. Each component to be taken separately.

$$\int_0^{2\pi} f^{\text{conj}} L_z \cdot g d\phi = (-i \cdot h') \cdot \int_0^{2\pi} f^{\text{conj}} -i \cdot h' \cdot \frac{d(g)}{d\phi} d\phi$$

Integrating by parts RHS term:  $\int u dv = u \cdot v - \int v du$

$$(-i \cdot h') \cdot \int_0^{2\pi} f^{\text{conj}} -i \cdot h' \cdot \frac{d(g)}{d\phi} d\phi = (-i \cdot h') \cdot \left( \left( f^{\text{conj}} \cdot g \right) - \int_0^{2\pi} \left( g \cdot \frac{d(f^{\text{conj}})}{d\phi} \right) d\phi \right)$$

lim  
2pi - 0

The first term on the RHS above results in zero, when the limits are applied, because of the single-valuedness of the wavefunction. Example 6.15 a similar intergration, its correct above.

Next why the zero our functions are like  $\sin(x)$ :

$$\begin{aligned} f^{\text{conj}}(2\pi) &= f^{\text{conj}}(0) \\ g(2\pi) &= g(0) \end{aligned}$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Removing the zero term results in:

$$\begin{aligned}
 (-i \cdot \hbar') \cdot \int_0^{2\pi} f^{\text{conj}} - i \cdot \hbar' \cdot \frac{d(g)}{d\phi} d\phi &= (-i \cdot \hbar') \cdot \left( - \int_0^{2\pi} \left( g \cdot \frac{d(f^{\text{conj}})}{d\phi} \right) d\phi \right) \\
 &= (i \cdot \hbar') \cdot \left( \int_0^{2\pi} \left( g \cdot \frac{d(f^{\text{conj}})}{d\phi} \right) d\phi \right) \\
 &= \left( \int_0^{2\pi} g \cdot \left( i \hbar' \frac{d}{d\phi} \right) \cdot (f^{\text{conj}}) d\phi \right)
 \end{aligned}$$

$$L_Z^{\text{conj}} = \left( i \hbar' \frac{d}{d\phi} \right) \text{ positive here for } L_Z \text{ so its conjugate } L_Z.$$

$$= \left( \int_0^{2\pi} g \cdot L_Z^{\text{conj}} \cdot (f^{\text{conj}}) d\phi \right) \text{ Substitute for } L_Z \text{ conjugate because its a positive term.}$$

$$\int_0^{2\pi} f^{\text{conj}} L_Z \cdot g d\phi = \int_0^{2\pi} g \cdot L_Z^{\text{conj}} \cdot (f^{\text{conj}}) d\phi \quad \text{Ans. Convincing! No?}$$

You are welcome to improve on this.

### **Some major property areas of Hermitian:**

A: Sum and product:

1. Sum or difference of 2 hermitian operators results in a hermitian.
2. Same for product of 2 hermitians

B: Hermitian conjugate

C: Hermitian adjoint

D: Hermitian adjoint of the sum and product of two arbitrary operators.

These found in 'some' QM or Modern Physics textbooks.

 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Example Problem 6.15 Check For Hermitian Operator.

Is the momentum operator p Hermitian?

**Solution:**

Recap notes:

What is a Hermitian operator?

If the following relationship holds:

$$\int \phi_{\text{conj}}(x) \cdot [A \cdot \psi(x)] dx = \int (\phi^{\text{conj}}(x) \cdot A^{\text{conj}}) \cdot \psi(x) dx$$

When this holds we say operator A is Hermitian.

Hermitian operators which have real eigenvalues are fundamentally important in QM.

Quantities which can be measured experimentally, like energy or momentum, are represented by Hermitian operators.

We change operator A for operator p:

$$\int \phi_{\text{conj}}(x) \cdot [p \cdot \psi(x)] dx = \int \psi(x) \cdot p^{\text{conj}} \cdot \phi^{\text{conj}}(x) dx \quad \leftarrow \text{Follow carefully the expression.}$$

The term in the LHS  $p = -i\hbar \cdot \frac{d}{dx}$

Now LHS term is:

$$\begin{aligned} \int \phi_{\text{conj}}(x) \cdot [p \cdot \psi(x)] dx &= \int \phi_{\text{conj}}(x) \cdot \left[ -i\hbar \cdot \left( \frac{d}{dx} \right) \cdot \psi(x) \right] dx \\ &= -i\hbar \int \phi_{\text{conj}}(x) \cdot \left[ \frac{d(\psi(x))}{dx} \right] dx \quad \leftarrow \text{Intergrate this term} \end{aligned}$$

Using intergration by parts:

$$\int u dv = u \cdot v - \int v du$$

$u = \phi_{\text{conj}}(x)$

$$\frac{du}{dx} = \frac{d \phi_{\text{conj}}(x)}{dx}$$

$$du = \frac{d \phi_{\text{conj}}(x)}{dx} dx \quad \text{OR write it like this } \rightarrow \frac{d}{dx} \cdot \phi_{\text{conj}}(x) \cdot dx$$

Next for the v term in intergration by parts

$$dv = \psi(x) dx \quad \text{next intergrate wrt } dv \text{ and } dx$$

$$\int 1 dv = \int \psi(x) dx$$

$$v = \psi(x)$$

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\int u dv = u \cdot v - \int v du$$

$$\int \phi_{\text{conj}}(x) \frac{d\phi}{dx} dx = \phi_{\text{conj}}(x) \cdot \psi(x) - \int \psi(x) \cdot \frac{d\phi_{\text{conj}}(x)}{dx} dx$$

placing the constant term  $\hbar$  in front

$$\int \phi_{\text{conj}}(x) \frac{d\phi}{dx} dx = -\hbar \left( \phi_{\text{conj}}(x) \cdot \psi(x) - \int \psi(x) \cdot \frac{d\phi_{\text{conj}}(x)}{dx} dx \right)$$

$$\int \phi_{\text{conj}}(x) \frac{d\phi}{dx} dx = -\hbar \left( \phi_{\text{conj}}(x) \cdot \psi(x) - \int \psi(x) \cdot \frac{d\phi_{\text{conj}}(x)}{dx} dx \right)$$

As the limits approach infinity, the first term  $\Phi(x)_{\text{conj}} \Psi(x)$  on the RHS approaches  $\pm$  infinity, the term cancels out (pos + neg infinity).

Leaving

$$\int \phi_{\text{conj}}(x) \frac{d\phi}{dx} dx = \hbar \int \psi(x) \cdot \frac{d\phi_{\text{conj}}(x)}{dx} dx$$

$$= \hbar \int \left( \frac{d\phi(x)}{dx} \right) \cdot \psi(x) dx = \int \left( \hbar \cdot \frac{d}{dx} \right) \cdot \phi_{\text{conj}}(x) \cdot \psi(x) dx$$

$$p^{\text{conj}} \cdot \psi(x) = \hbar \cdot \frac{d}{dx} \quad \text{Since the expression is positive it is the conjugate of } p.$$

$$= \int p^{\text{conj}} \cdot \phi_{\text{conj}}(x) \cdot \psi(x) dx$$

$$\int \phi_{\text{conj}}(x) \cdot [p \cdot \psi(x)] dx = \int p^{\text{conj}} \cdot \phi_{\text{conj}}(x) \cdot \psi(x) dx$$

*Comments:*

*Its not a clean example for me. You may be good at proof(s) to correct this for errors.*

*Most of my experience in proof problems was not pleasant and I am not alone among few. Most can do very well in these types of problems.*

*Lots of proof examples are available in most QM textbooks.*

*So far I had not found a quantitative example on Hermitian in textbooks. Its the mathematical techniques of Hermitian which are applied in quantitative solutions.*

Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Notes: Fourier Transform for determining space and momentum wavefunction:

The fact that momentum can be expressed as  $p = h \cdot k$  allows us to define a momentum space wavefunction that is related to the position space wavefunction, this is achieved thru the Fourier transform.

Similarly for achieving a position wavefunction from a momentum space wavefunction.

Fourier Transform:

$$f(x) := \left( \frac{1}{\sqrt{2\pi}} \right) \int_{-\infty}^{\infty} F(k) \cdot e^{i \cdot k \cdot x} dk \quad \text{positive exp.}$$

$$F(x) := \left( \frac{1}{\sqrt{2\pi}} \right) \int_{-\infty}^{\infty} f(x) \cdot e^{-i \cdot k \cdot x} dx \quad \text{negative exp.}$$

So how do we determine the momentum and space wavefunctions:

1). Apply Fourier Transform on momentum space function to get the space wavefunction.

$$\psi(x) = \left( \frac{1}{\sqrt{2\pi \cdot h'}} \right) \int_{-\infty}^{\infty} \phi(P) \cdot e^{\frac{i \cdot p \cdot x}{h'}} dp \quad \text{positive exp.}$$

2). Apply Fourier Transform on position space function to get the momentum wavefunction.

$$\phi(p) = \left( \frac{1}{\sqrt{2\pi \cdot h'}} \right) \int_{-\infty}^{\infty} \psi(x) \cdot e^{\frac{-i \cdot p \cdot x}{h'}} dx \quad \text{negative exp.}$$

Non-Commercial Use Only

Example Problem 6.17 Fourier Transform To Find Momentum. D McMahon.

Suppose that

$$\psi(x) := \left( \frac{1}{\sqrt{a}} \right) \quad -a \leq x \leq a$$

Find the momentum space  $\Phi(p)$  ?

**Solution:**

$$\begin{aligned} \phi(p) &= \left( \frac{1}{\sqrt{2\pi\hbar'}} \right) \int_{-\infty}^{\infty} \psi(x) \cdot e^{\frac{-i \cdot p \cdot x}{\hbar'}} dp \\ &= \left( \frac{1}{\sqrt{2\pi\hbar'}} \right) \int_{-\infty}^{\infty} \left( \frac{1}{\sqrt{a}} \right) \cdot e^{\frac{-i \cdot p \cdot x}{\hbar'}} dp \\ &= \left( \frac{1}{\sqrt{2\pi\hbar'}} \right) \left( \frac{1}{\sqrt{a}} \right) \left( \frac{\hbar'}{-i \cdot p} \right) \left( e^{\frac{-i \cdot p \cdot x}{\hbar'}} \right) \lim_{a \rightarrow -a} \end{aligned}$$

Set the exponential term to a form that can be replaced by a simplified trig term

$$\begin{aligned} &= \left( \frac{1}{\sqrt{2\pi\hbar'}} \right) \left( \frac{1}{\sqrt{a}} \right) \left( \frac{2\hbar'}{p} \right) \left( \frac{e^{\frac{i \cdot p \cdot x}{\hbar'}} - e^{\frac{-i \cdot p \cdot x}{\hbar'}}}{2i} \right) \\ &= \left( \frac{2\hbar'}{\sqrt{2\hbar'}} \right) \left( \frac{1}{\sqrt{\pi}} \right) \left( \frac{1}{\sqrt{a}} \right) \left( \frac{1}{p} \right) \left( \frac{e^{\frac{i \cdot p \cdot a}{\hbar'}} - e^{\frac{-i \cdot p \cdot a}{\hbar'}}}{2i} \right) \\ &= \left( \frac{\sqrt{2\hbar'}}{1} \right) \left( \frac{1}{\sqrt{\pi}} \right) \left( \frac{1}{\sqrt{a}} \right) \left( \frac{1}{p} \right) \left( \frac{e^{\frac{i \cdot p \cdot a}{\hbar'}} - e^{\frac{-i \cdot p \cdot a}{\hbar'}}}{2i} \right) \\ &= \left( \frac{a}{a} \right) \left( \frac{\hbar'}{\hbar'} \right) \cdot \left( \frac{\sqrt{2\hbar'}}{\sqrt{\pi a}} \right) \left( \frac{1}{p} \right) \cdot \sin\left(\frac{pa}{\hbar'}\right) = \left( \frac{a}{\hbar'} \right) \left( \frac{\sqrt{2\hbar'}}{\sqrt{\pi a}} \right) \left( \frac{\hbar'}{pa} \right) \cdot \sin\left(\frac{pa}{\hbar'}\right) \\ &= \left( \frac{\sqrt{a}}{\sqrt{\hbar'}} \right) \left( \frac{\sqrt{2}}{\sqrt{\pi}} \right) \left( \frac{\hbar'}{pa} \right) \cdot \sin\left(\frac{pa}{\hbar'}\right) = \left( \frac{\sqrt{2a}}{\sqrt{\pi h'}} \right) \left( \frac{\hbar'}{pa} \right) \cdot \sin\left(\frac{pa}{\hbar'}\right) \\ &= \left( \frac{\sqrt{2a}}{\sqrt{\pi h'}} \right) \cdot \frac{\sin\left(\frac{pa}{\hbar'}\right)}{\left(\frac{pa}{\hbar'}\right)} = \left( \frac{\sqrt{2a}}{\sqrt{\pi h'}} \right) \cdot \text{sinc}\left(\frac{pa}{\hbar'}\right) \quad \text{Ans.} \end{aligned}$$

Example Problem 6.18 Fourier Transform To Find Position. D McMahon.

Suppose that

$$\phi(k) := e^{\left(-\frac{a}{b}\right) \cdot (k-k_0)^2}$$

Use the fourier Transform to find  $\psi(p)$

**Solution:**

$$\begin{aligned} \psi(x) &= \left(\frac{1}{\sqrt{2\pi}}\right) \int_{-\infty}^{\infty} \phi(k) \cdot e^{i \cdot k \cdot x} dk \\ &= \left(\frac{1}{\sqrt{2\pi}}\right) \int_{-\infty}^{\infty} \left(e^{\left(-\frac{a}{b}\right) \cdot (k-k_0)^2}\right) \cdot e^{i \cdot k \cdot x} dk \end{aligned}$$

The 2 exponential terms makes it difficult to intergrate. Here attempting to manually do this is not an option. So we will use intergral tables. The form provided below.

$$\int_{-\infty}^{\infty} e^{-\alpha u^2} \cdot e^{\beta u} du = \sqrt{\frac{\pi}{\alpha}} \cdot e^{\frac{\beta^2}{4\alpha}}$$

$$\begin{aligned} \text{Let } u &= (k-k_0) \cdot \sqrt{\frac{a}{b}} & dk &:= (k-k_0) \quad u = dk \cdot \sqrt{\frac{a}{b}} \\ \left(\sqrt{\frac{b}{a}}\right) u &= (k-k_0) \\ k &= \left(\sqrt{\frac{b}{a}}\right) u + k_0 \end{aligned}$$

Substitute the terms above into the intergral expression.

$$= \left(\frac{1}{\sqrt{2\pi}}\right) \int_{-\infty}^{\infty} \left(e^{\left(-\frac{a}{b}\right) \cdot (k-k_0)^2}\right) \cdot e^{i \cdot k \cdot x} dk = \left(\frac{1}{\sqrt{2\pi}}\right) \cdot \left(\sqrt{\frac{b}{a}}\right) \int_{-\infty}^{\infty} \left(e^{u^2}\right) \cdot e^{i \cdot \left(\left(\sqrt{\frac{b}{a}}\right) u + k_0\right) \cdot x} du$$

$$\left(\frac{1}{\sqrt{2\pi}}\right) \cdot \left(\sqrt{\frac{b}{a}}\right) \cdot e^{ik_0x} \int_{-\infty}^{\infty} \left(e^{u^2}\right) \cdot e^{i \cdot \left(\sqrt{\frac{b}{a}}\right) u \cdot x} du \quad <---\text{rearranging}$$

$$\int_{-\infty}^{\infty} e^{-\alpha u^2} \cdot e^{\beta u} du \quad \text{Lets match up the table integral form to the expression above.}$$

$$\text{From } \left(e^{u^2}\right) \quad \alpha := 1 \quad \text{From } e^{i \cdot \left(\sqrt{\frac{b}{a}}\right) u \cdot x} \quad \beta := i \cdot \left(\sqrt{\frac{b}{a}}\right) \cdot x$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\sqrt{\frac{\pi}{a}} \cdot e^{-\frac{\beta^2}{4\alpha}} \quad \leftarrow \text{The solution form from tables.}$$

Next plug-in the values for alpha and beta: 
$$\sqrt{\frac{\pi}{1}} \cdot e^{-\frac{\left(i \cdot \left(\sqrt{\frac{b}{a}}\right) \cdot x\right)^2}{4}}$$

$$= \frac{\sqrt{\pi} \cdot e^{-1 \left(\frac{b}{a}\right) \cdot x^2}}{4}$$

$$= \sqrt{\pi} \cdot e^{-\left(\frac{b \cdot x^2}{a \cdot 4}\right)}$$

Now presenting the full integral with the constant terms:

$$\psi(x) = \left(\frac{1}{\sqrt{2\pi}}\right) \cdot \left(\sqrt{\frac{b}{a}}\right) \cdot e^{ik_0x} \cdot \left(\sqrt{\pi} \cdot e^{-\left(\frac{b \cdot x^2}{a \cdot 4}\right)}\right)$$

$$\psi(x) = \left(\sqrt{\frac{b}{2a}}\right) \cdot e^{ik_0x} \cdot \left(e^{-\left(\frac{b \cdot x^2}{a \cdot 4}\right)}\right) \quad \text{Ans. The space wavefunction}$$

Non-Commercial Use Only

Example 6.19 Uncertainty Principle. D McMahon.

A particle of mass m in a one dimensional box is found to be in the ground state:

$$\psi(x) := \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right)$$

Find  $\Delta x \Delta p$  for this state.

**Solution:**

One dimensional box we set the upper limit a and lower limit 0.

We know we can define momentum p as:  $-i\hbar \cdot \frac{d}{dx}$

$$\text{momentum } p^2 \text{ as: } -i\hbar \cdot \frac{d^2}{dx^2}$$

We need to calculate:

$$1). \int_0^a \psi_{\text{conj}}(x) \cdot p \cdot \psi(x) dx$$

$$2). \int_0^a \psi_{\text{conj}}(x) \cdot p^2 \cdot \psi(x) dx$$

Then the same for x.

Right most 2 terms of 1 and 2 above:

$$p \cdot \psi(x) = -i\hbar \cdot \frac{d}{dx} \sqrt{\frac{2}{a}} \sin\left(\frac{\pi x}{a}\right) = -i\hbar \sqrt{\frac{2}{a}} \cdot \left(\frac{\pi}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) = -\frac{i \hbar'}{a} \sqrt{\frac{2}{a}} \cdot \cos\left(\frac{\pi x}{a}\right)$$

$$\begin{aligned} p^2 \cdot \psi(x) &= \frac{d}{dx} i\hbar' \left(-\frac{i \hbar'}{a} \sqrt{\frac{2}{a}} \cdot \cos\left(\frac{\pi x}{a}\right)\right) = (i^2 \cdot \hbar'^2) \sqrt{\frac{2}{a}} \cdot \left(\frac{\pi^2}{a^2}\right) \cdot -\sin\left(\frac{\pi x}{a}\right) \\ &= -(\hbar'^2) \sqrt{\frac{2}{a}} \cdot \left(\frac{\pi^2}{a^2}\right) \cdot \sin\left(\frac{\pi x}{a}\right) = -\left(\frac{\hbar'^2 \cdot \pi^2}{a^2}\right) \sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi x}{a}\right) \end{aligned}$$

$$\begin{aligned} \langle p \rangle &= \int_0^a \psi_{\text{conj}}(x) \cdot p \cdot \psi(x) dx = -\int_0^a \sqrt{\frac{2}{a}} \sin\left(\frac{\pi x}{a}\right) \cdot \frac{i \hbar'}{a} \sqrt{\frac{2}{a}} \cdot \cos\left(\frac{\pi x}{a}\right) dx \\ &= -\left(\frac{2 \cdot i \hbar'}{a^2}\right) \int_0^a \sin\left(\frac{\pi x}{a}\right) \cdot \cos\left(\frac{\pi x}{a}\right) dx \end{aligned}$$

We did this intergral in a previous example.

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.

2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.

Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.

Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\langle p \rangle = -\left(\frac{2 \cdot i \cdot h}{a^2}\right) \left[ \pi \cos^2 \left( \frac{\pi \cdot x}{a} \right) \right] \quad \text{Lim } x = a \text{ to } 0$$

$$a: \quad \left(\frac{2 \cdot i \cdot h}{a^2}\right) \left[ \pi \cos^2 (\pi) \right] = \left(\frac{2 \cdot i \cdot h}{a^2}\right) \pi \quad \cos(\pi) = -1, \cos^2(\pi) = 1$$

$$0: \quad \left(\frac{2 \cdot i \cdot h}{a^2}\right) \left[ \pi \cos^2 (0) \right] = \left(\frac{2 \cdot i \cdot h}{a^2}\right) \pi \quad \cos(0) = 1, \cos^2(0) = 1$$

Result limit a to 0:

$$\langle p \rangle = \left(\frac{2 \cdot i \cdot h}{a^2}\right) - \left(\frac{2 \cdot i \cdot h}{a^2}\right) \pi = 0$$

$$\langle p^2 \rangle = \int_0^a \psi_{\text{conj}}(x) \cdot p^2 \cdot \psi(x) dx$$

$$\int_0^a \left( -\left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \right) \cdot \left( -\left(\frac{h^2 \cdot \pi^2}{a^2}\right) \sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \right) dx$$

$$\int_0^a \left( \left(\sqrt{\frac{2}{a}}\right) \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \right) \cdot \left( \left(\frac{h^2 \cdot \pi^2}{a^2}\right) \sqrt{\frac{2}{a}} \cdot \sin\left(\frac{\pi \cdot x}{a}\right) \right) dx$$

$$\left(\frac{2}{a}\right) \cdot \left(\frac{h^2 \cdot \pi^2}{a^2}\right) \cdot \int_0^a \left( \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) \right) dx$$

$$\left(\frac{2 \cdot h^2 \cdot \pi^2}{a^3}\right) \cdot \int_0^a \left( \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) \right) dx$$

$$\left(\frac{1}{2}\right) \cdot \int_0^a 1 - \left( \cos \cdot \left(\frac{2 \cdot \pi \cdot x}{a}\right) \right) dx = \left(\frac{1}{2}\right) \left( x - \left(\frac{2 \cdot \pi}{a}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right) \right)$$

$$= \left(\frac{x}{2} - \left(\frac{\pi}{a}\right) \cdot \sin\left(\frac{2 \cdot \pi \cdot x}{a}\right)\right)$$

$$\text{Lim } a \text{ to } 0 = \left(\frac{a}{2}\right) - 0 = \left(\frac{a}{2}\right)$$

$$\langle p^2 \rangle = \left(\frac{2 \cdot h^2 \cdot \pi^2}{a^3}\right) \cdot \left(\frac{a}{2}\right) = \left(\frac{h^2 \cdot \pi^2}{a^2}\right)$$

Non-Commercial Use Only

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\Delta p = \sqrt{(p^2) - (p)^2}$$

$$= \sqrt{\left(\frac{h^2 \cdot \pi^2}{a^2}\right) - 0}$$

$$\Delta p = \frac{h \cdot \pi}{a} \quad \text{Solved for delta p.}$$

Next solve for delta x:

$$\langle x \rangle : \int_0^a \psi_{\text{conj}}(x) \cdot x \cdot \psi(x) dx$$

and

$$\langle x^2 \rangle : \int_0^a \psi_{\text{conj}}(x) \cdot x^2 \cdot \psi(x) dx$$

$$\langle x \rangle : \int_0^a \left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right) (x) \cdot \left(\sqrt{\frac{2}{a}}\right) \sin\left(\frac{\pi \cdot x}{a}\right) dx$$

$$= \left(\frac{2}{a}\right) \cdot \int_0^a x \cdot \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) dx \quad \text{See example 6.9 for the steps.}$$

$$\langle x \rangle : \frac{a}{2}$$

$$\langle x^2 \rangle : \int_0^a \psi_{\text{conj}}(x) \cdot x^2 \cdot \psi(x) dx$$

$$= \left(\frac{2}{a}\right) \cdot \int_0^a x^2 \cdot \sin^2 \cdot \left(\frac{\pi \cdot x}{a}\right) dx \quad \text{Follow example 6.9 change x for } x^2$$

$$= \left(\frac{2}{a}\right) \cdot \int_0^a x^2 dx - \left(\frac{1}{a}\right) \cdot \int_0^a x^2 \cdot \left(\cos\left(\frac{2 \cdot \pi \cdot x}{a}\right)\right) dx$$

First term:

$$\left(\frac{2}{a}\right) \cdot \left(\frac{1}{3}\right) \cdot x^3 = \left(\frac{2}{a}\right) \cdot \left(\frac{1}{3}\right) \cdot a^3 = \left(\frac{2}{3}\right) \cdot a^2$$

$$\text{Lim } a \rightarrow 0$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
 2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
 Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

Second term apply intergration by parts.

$$\left(\frac{1}{a}\right) \cdot \int_0^a x^2 \cdot \left(\cos\left(\frac{2 \cdot \pi \cdot x}{a}\right)\right) dx$$

$$\text{Let } \frac{dy}{dx} = x^2 \cdot \left(\cos\left(\frac{2 \pi \cdot x}{a}\right)\right)$$

$$dy = x^2 \cdot \cos\left(\frac{2 \pi \cdot x}{a}\right) dx$$

$$\text{Let } u = x^2 \quad \frac{du}{dx} = 2x$$

$$\text{so } du = 2x \cdot dx$$

$$\frac{dv}{dx} = \left(\cos\left(\frac{2 \pi \cdot x}{a}\right)\right)$$

$$dv = \left(\cos\left(\frac{2 \pi \cdot x}{a}\right)\right) dx$$

$$\int 1 dv = \int \left(\cos\left(\frac{2 \pi \cdot x}{a}\right)\right) dx$$

$$v = \left(\frac{a}{2 \cdot \pi}\right) \cdot \left(\sin\left(\frac{2 \pi \cdot x}{a}\right)\right)$$

$$\int u dv = u \cdot v - \int v du$$

$$\int u dv = \int x^2 \cdot \left(\cos\left(\frac{2 \pi \cdot x}{a}\right)\right) dx$$

$$u \cdot v = \left(\frac{a \cdot x^2}{2 \cdot \pi}\right) \cdot \left(\sin\left(\frac{2 \pi \cdot x}{a}\right)\right)$$

$$\int v du = \int \left(\frac{a}{2 \cdot \pi}\right) \cdot \left(\sin\left(\frac{2 \pi \cdot x}{a}\right)\right) \cdot 2x dx$$

$$= \int \left(\frac{a \cdot x}{\pi}\right) \cdot \left(\sin\left(\frac{2 \pi \cdot x}{a}\right)\right) dx$$

Non-Commercial Use Only

Placing the terms in order:

$$\int u dv = u \cdot v - \int v du$$

$$\int x^2 \cdot \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right) dx = \left( \frac{ax^2}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) - \int \left( \frac{a \cdot x}{\pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) dx$$

$$= \left( \frac{ax^2}{2 \cdot \pi} \right) \cdot \left( \sin \left( \frac{2 \pi \cdot x}{a} \right) \right) + \left( \frac{a \cdot x}{\pi} \right) \cdot \left( \frac{a}{2 \pi} \right) \left( \cos \left( \frac{2 \pi \cdot x}{a} \right) \right)$$

$$= \left( \frac{ax^2}{2 \cdot \pi} \right) \cdot \sin \left( \frac{2 \pi \cdot x}{a} \right) + \left( \frac{a^2 x}{2 \pi^2} \right) \cdot \cos \left( \frac{2 \pi \cdot x}{a} \right)$$

Taking the limit a - 0

Lim a:

$$= \left( \frac{a^3}{2 \cdot \pi} \right) \cdot \sin(2 \pi) + \left( \frac{a^3}{2 \pi^2} \right) \cdot \cos(2 \pi) = \left( \frac{a^3}{2 \pi^2} \right) \quad \text{Note: } \cos(2 \pi) = 1$$

$$\sin(2 \pi) = 1$$

Lim 0:

$$= 0$$

$$\left( \frac{1}{a} \right) \cdot \int_0^a x^2 \cdot \left( \cos \left( \frac{2 \cdot \pi \cdot x}{a} \right) \right) dx = \left( \frac{1}{a} \right) \cdot \left( \frac{a^3}{2 \pi^2} \right) = \frac{a^2}{2 \pi^2} \quad \text{The 2nd term's result.}$$

$$\text{Final result for the integral } \left( \frac{2}{a} \right) \cdot \int_0^a x^2 dx - \left( \frac{1}{a} \right) \cdot \int_0^a x^2 \cdot \left( \cos \left( \frac{2 \cdot \pi \cdot x}{a} \right) \right) dx$$

$$= \left( \frac{2 a^2}{3} \right) - \left( \frac{a^2}{2 \pi^2} \right)$$

$$\langle x^2 \rangle = \left( \frac{a^2}{6} \right) \cdot \left( 2 - \frac{3}{\pi^2} \right)$$

$$\Delta x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$$

$$= \sqrt{\left( \left( \frac{a^2}{6} \right) \cdot \left( 2 - \frac{3}{\pi^2} \right) \right) - \left( \frac{a}{2} \right)^2} \quad \text{OR} \quad \sqrt{\left( \frac{2 a^2}{3} \right) - \left( \frac{a^2}{2 \pi^2} \right) - \left( \frac{a}{2} \right)^2}$$

$$= \sqrt{\left( \frac{2 a^2}{3} \right) - \left( \frac{a^2}{2 \pi^2} \right) - \left( \frac{a^2}{4} \right)}$$

$$= a \sqrt{\left( \frac{2}{3} \right) - \left( \frac{1}{2 \pi^2} \right) - \left( \frac{1}{4} \right)} = a \sqrt{\left( \frac{8-3}{12} \right) - \left( \frac{1}{2 \pi^2} \right)} = \frac{a}{\pi} \sqrt{\left( \frac{5 \pi^2}{12} \right) - \left( \frac{6}{12} \right)}$$

$$\Delta x = \frac{a}{\pi} \sqrt{\frac{5 \pi^2 - 6}{12}} = 0.605 \cdot a$$

1). Main Textbook: QM Demystified: A self teaching guide. David McMahon. McGraw-Hil. Support Studies: Modern Physics by S.N. Ghosal.  
2). To Support Relevant Chapters In: Quantum Mechanics A Textbook for Undergraduates. Mahesh C. Jain.  
Purpose: Quantum Mechanics for 'Power Plant Engineering' Studies.  
Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\begin{aligned}\text{Now we solve for: } \Delta x \Delta p &= (0.605 \cdot a) \left( \frac{h' \cdot \pi}{a} \right) \\ &= (0.605 \pi) (h')\end{aligned}$$

$$\Delta x \Delta p = (1.901) (h') \text{ is greater than } h'. \text{ Ans.}$$

Uncertainty relation Chapter 9 section 13 (9.13)  
in Atomic Physics (SN Ghoshal):

$$\Delta x \Delta p \geq h'$$

Section 10.13 Formal proof of the  
Uncertainty Relation (SN Ghoshal):  $\Delta x \Delta p \geq \frac{h'}{2}$

The Heisenberg uncertainty principle :  $\Delta x \Delta p \geq h'$  page 56 QM Demystified D McMahon.

Page 232 Atomic Physics (SN Ghoshal):

Thus the wave representation of the particle implies some uncertainty  $\Delta x$  of the position  $x$  of the particle and a corresponding uncertainty  $\Delta p$  in specifying its momentum  $p$  simultaneously.

The more exactly we want to localise the particle (smaller uncertainty  $\Delta x$  in the position  $x$ ) the less exactly specified will be the momentum (greater uncertainty  $\Delta p$  in the momentum  $p$ ). Heisenberg was the first to point out this inherent limitation in specifying the position and momentum of a particle regarded as a wave, which is known as the uncertainty principle.

*Comments:*

*Some relief is here because D McMahon wrote the book QM Demystified.*

*There is the Schaum's Series books they have a QM book. If you have seen or used Schaum's Series books, they are helpful. In this case for QM McMahon's book is effective on the subject material for what he is delivering at UG level.*

*We have not touched on Schrodinger's Equation for what it can do in QM, just a some mathematics on how to apply Schrodinger's Equation.*

*This is just at the introduction level, knowing advanced mathematics there maybe untold math to encounter. To that level I am not prepared to engage, maybe most of you are the same here on that. Most NOT all!*

### Notes on Probability Current Density.

Electromagnetic theory has something similar, current density, if not first encountered in that subject matter. Not exactly the same here.

Electromagnetic theory has it's famous Maxwell's equation.

If you remember how Green's theorem or Gauss' divergence theorem from calculus which was applied in electromagnetic theory. Here is not a form of QM with special value to electrical engineering. So, take that thought out again its QM.

The understanding on probability current density can be achieved from all modern physics or QM textbooks.

Some key equations are presented here you look up their explanations wrt QM.  
 From QM For UG (Mahesh Jain) pages 101 - 102:

How to read the equations below above: If a particle is described by a wavefunction  $\Psi(r,t)$ , then the probability of finding the particle, at time  $t$ , within the volume element  $dr = dx dy dz$  about the point  $r = (x,y,z)$  is:

$$P(r, t) dr = |\Psi(r, t)|^2 dr = \Psi^{\text{conj}}(r, t) \Psi(r, t) dr$$

$$P(r, t) = |\Psi(r, t)|^2 = \Psi^{\text{conj}}(r, t) \Psi(r, t) \quad \leftarrow \text{Position probability density.}$$

$$\int |\Psi(r, t)|^2 dr = 1 \quad \text{Since probability of finding the particle somewhere at time } t \text{ is unity, the wavefunction is } \underline{\text{chosen to satisfy}} \text{ the normilisation condition.}$$

Short exercise here to form an equation:

$$\nabla^2 = \frac{d^2}{dx^2} + \frac{d^2}{dy^2} + \frac{d^2}{dz^2}$$

Because of the text editor limitation on the version here, another symbol is used:

$$\Delta'^2 = \nabla^2 = \frac{d^2}{dx^2} + \frac{d^2}{dy^2} + \frac{d^2}{dz^2} \quad \boxed{\Delta'^2 = \nabla^2 \text{ Because of text editor limitation}}$$

$$i\hbar \left( \frac{d\Psi}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \Delta'^2 \Psi + V \Psi \quad \leftarrow \text{1st expression}$$

and

$$-i\hbar \left( \frac{d\Psi^{\text{conj}}}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \Delta'^2 \Psi^{\text{conj}} + V \Psi^{\text{conj}} \quad \leftarrow \text{2nd expression, complex conjugate of 1st term}$$

Where  $V(r, t)$  in both the 1st and 2nd expression is assumed to be real.  
 $V$  being the potential difference should be real.

We want to show:

$$\frac{d}{dt} \int P(r, t) dr = \frac{d}{dt} \int \psi^{\text{conj}}(r, t) \psi(r, t) dr = 0$$

Taking derivative on the LHS wrt time, saying lets see what happens when time changes.

Multiply the LHS of 1st term by  $\psi^{\text{conj}}$

$$i\hbar \left( \psi^{\text{conj}} \frac{d\psi}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \psi^{\text{conj}} \cdot \Delta'^2 \psi + \psi^{\text{conj}} \cdot V \psi \quad \text{<--- 3rd expression}$$

Multiply the LHS of 2nd expression by  $\psi$

$$-i\hbar \left( \psi \frac{d\psi^{\text{conj}}}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \psi \cdot \Delta'^2 \psi^{\text{conj}} + \psi \cdot V \psi^{\text{conj}} \quad \text{<--- 4th expression}$$

Subtract expression 4 from 3; 3 - 4:

$$i\hbar \left( \psi^{\text{conj}} \frac{d\psi}{dt} + \psi \cdot \frac{d\psi^{\text{conj}}}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \psi^{\text{conj}} \cdot \Delta'^2 \psi - \left( -\frac{\hbar^2}{2m} \right) \psi \cdot \Delta'^2 \psi^{\text{conj}} \quad \text{<--- 5th expression}$$

$$i\hbar \left( \psi^{\text{conj}} \frac{d\psi}{dt} + \psi \cdot \frac{d\psi^{\text{conj}}}{dt} \right) = \left( -\frac{\hbar^2}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta'^2 \psi - \psi \cdot \Delta'^2 \psi^{\text{conj}})$$

Note:  $-\frac{1}{i} = 1i$

$\Delta'^2 = \nabla^2$  Because of text editor limitation

$$\left( \psi^{\text{conj}} \frac{d\psi}{dt} + \psi \cdot \frac{d\psi^{\text{conj}}}{dt} \right) = \left( \frac{i\hbar}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta'^2 \psi - \psi \cdot \Delta'^2 \psi^{\text{conj}})$$

$$\left( \psi^{\text{conj}} \frac{d\psi}{dt} + \psi \cdot \frac{d\psi^{\text{conj}}}{dt} \right) \quad \text{<--- This term on the LHS is the derivative of the product } \psi^{\text{conj}}(x) \text{ and } \psi(x).$$

Consider the time derivative of the intergral, term above, over a finite volume V:

$$\begin{aligned} \frac{d}{dt} \int_V (\psi^{\text{conj}} \cdot \psi) dr &= \frac{d}{dt} \int_V \left( \psi^{\text{conj}} \frac{d\psi}{dt} + \psi \cdot \frac{d\psi^{\text{conj}}}{dt} \right) dr \\ &= \left( \frac{i\hbar}{2m} \right) \cdot \int_V (\psi^{\text{conj}} \cdot \Delta'^2 \psi - \psi \cdot \Delta'^2 \psi^{\text{conj}}) dr \end{aligned}$$

$$= \left( \frac{i\hbar}{2m} \right) \cdot \int_V \Delta' \cdot (\psi^{\text{conj}} \cdot \Delta' \psi - \psi \cdot \Delta' \psi^{\text{conj}}) dr$$

We pull out the expression =  $\left( \frac{i\hbar}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta' \psi - \psi \cdot \Delta' \psi^{\text{conj}})$  for a vector set it =  $j(r, t)$

$$j(r, t) = \left( \frac{i\hbar}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta' \psi - \psi \cdot \Delta' \psi^{\text{conj}}) \quad \text{<---vector <--- 6th expression}$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$j(r, t) = \left( \frac{\hbar}{2m} \right) \cdot (\Psi^{\text{conj}} \cdot \nabla \Psi - \Psi \cdot \nabla \Psi^{\text{conj}}) \leftarrow \text{this is the probability current density with proper symbol (copy paste).}$$

$$j(r, t) = \left( \frac{\hbar}{2m} \right) \cdot \left( \Psi^{\text{conj}} \cdot \frac{d}{dt} (\Psi) - \Psi \cdot \frac{d}{dt} (\Psi^{\text{conj}}) \right) \text{ Extending out by removing the symbol, this is what it is.}$$

$$j(r, t) = \left( \frac{\hbar}{2m} \right) \cdot (\Psi^{\text{conj}} \cdot \Delta' \Psi - \Psi \cdot \Delta' \Psi^{\text{conj}}) \quad \leftarrow \text{repeated her to invert i}$$

Note:  $\frac{1}{i} = -1i$

$$j(r, t) = - \left( \frac{\hbar}{2i \cdot m} \right) \cdot (\Psi^{\text{conj}} \cdot \Delta' \Psi - \Psi \cdot \Delta' \Psi^{\text{conj}}) \quad \text{To get the negative sign in the RHS for the j term below.}$$

LHS of expression 6 is equal to:  $\frac{d}{dt} \int_V (\Psi^{\text{conj}} \cdot \Psi) dr = \frac{d}{dt} \int P(r, t) dr$

Next substitute vector j into the 6th expression:

$$\frac{d}{dt} \int_V P(r, t) dr = - \int_V \Delta' \cdot j(r, t) dr \quad \leftarrow \text{7th expression}$$

Using Green's theorem (also called Gauss divergence theorem) we can convert the volume integral on the right into an integral over the surface area S bounding the volume V:

$$\frac{d}{dt} \int_V P(r, t) dr = - \int_S j(r, t) dS \quad \leftarrow \text{8th term}$$

where the vector dS has magnitude equal to an element dS of the surface S and is directed along the outward normal to dS.

When V is the entire space, as is the case in the normalisation integral, the surface S, in the 8th term, recedes to infinity. Since, a square integrable wave function vanishes at large distances, the surface integral becomes zero and hence the expression below is proved.

$$\frac{d}{dt} \int P(r, t) dr = \frac{d}{dt} \int \Psi^{\text{conj}}(r, t) \Psi(r, t) dr = 0$$

How do we read or interpret term 8 above, shown below again?

$$\frac{d}{dt} \int_V P(r, t) dr = - \int_S j(r, t) dS \quad \leftarrow \text{8th term}$$

It says that the rate of change of the probability of finding the particle in a volume V is equal to the probability flux passing through the surface S bounding V.

It is reasonable therefore to interpret the vector j(r,t) as probability current density OR simply probability current.

$$j(r, t) \leftarrow \text{probability current.}$$

 Exercise by: K S Bogha. **Basics For Schrodinger Equation Solutions. Rev: 0.**

$$\frac{d}{dt} P(r, t) = -(\Delta'' \cdot j(r, t)) \text{ <----7th expression without integral}$$

Rearranging 7th expression:

$$\frac{d}{dt} P(r, t) + \Delta'' \cdot j(r, t) = 0 \text{ <----9th expression}$$

$$\Delta'' = \nabla \text{ Because of text editor limitation}$$

The equation/expression above has the familiar form associated with the conservation of matter in a fluid of density P and current density j, in a medium in which there are no sources and sinks. This is called the **equation of continuity**.

$$\Delta'' = \nabla \text{ Because of text editor limitation}$$

*Expression 9 shown with the proper symbol using MS Paint.*

Probability current density, expression number 6 shown below, may also be written as:

$$j(r, t) = \left( \frac{ih'}{2m} \right) \cdot (\Psi^{\text{conj}} \cdot \Delta' \Psi - \Psi \cdot \Delta' \Psi^{\text{conj}})$$

$$j(r, t) = \text{Re} \cdot \left[ \Psi^{\text{conj}} \left( \frac{h'}{im} \right) \Delta' \Psi \right] \text{ <----> } j(r, t) = \text{Re} \cdot \left[ \Psi^{\text{conj}} \left( \frac{h'}{im} \right) \nabla \Psi \right]$$

*This was how QM A Textbook for UG presented the material, here briefly shown. The same material was presently using different expression in QM Demystified. Your textbook may have one of these two methods, or may be another. When it comes to math I only remember whats shown to me in the textbook presentation it may require I refresh or glance thru some tables, so there maybe several ways to present an equation. Usually the simplest of them is used. Maybe the KISS principle, Keep It Simple Silly. Sometimes it can be hard.*

### Problem 6.20

Calculate the probability current density  $j(x)$  for the wave function:

$$\psi(x) := \sin(3\pi \cdot x) e^{2ix}$$

**Solution:**

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta' \psi - \psi \cdot \Delta' \psi^{\text{conj}})$$

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot \left( \psi^{\text{conj}} \cdot \frac{d}{dx}(\psi) - \psi \cdot \frac{d}{dx}(\psi^{\text{conj}}) \right) \text{ this is our probability current density}$$

$$\psi(x) := \sin(3\pi \cdot x) e^{2ix}$$

$$\psi_{\text{conj}}(x) := \sin(3\pi \cdot x) e^{-2ix}$$

$$\frac{d}{dx} \psi(x) = 3\pi \cdot \cos(3\pi \cdot x) \cdot e^{2ix} + (2i) \sin(3\pi \cdot x) \cdot e^{2ix}$$

$$\frac{d}{dx} \psi_{\text{conj}}(x) = 3\pi \cdot \cos(3\pi \cdot x) \cdot e^{-2ix} + (2i) \sin(3\pi \cdot x) \cdot e^{-2ix}$$

Setting up the differentiation expression of the probability current:

$$\left( \psi^{\text{conj}} \cdot \frac{d}{dx}(\psi) - \psi \cdot \frac{d}{dx}(\psi^{\text{conj}}) \right)$$

$$= (\sin(3\pi \cdot x) e^{-2ix} \cdot (3\pi \cdot \cos(3\pi \cdot x) \cdot e^{2ix} + 2i \sin(3\pi \cdot x) \cdot e^{2ix}))$$

$$- (\sin(3\pi \cdot x) e^{-2ix} \cdot (3\pi \cdot \cos(3\pi \cdot x) \cdot e^{-2ix} + 2i \sin(3\pi \cdot x) \cdot e^{-2ix}))$$

$$= 3\pi \cdot \sin(3\pi \cdot x) \cdot \cos(3\pi \cdot x) + 2i \sin^2(3\pi \cdot x)$$

$$- 3\pi \cdot \sin(3\pi \cdot x) \cdot \cos(3\pi \cdot x) \cdot e^{-4x} + (2i) \sin^2(3\pi \cdot x) \cdot e^{-4x}$$

$$= (3\pi \cdot \sin(3\pi \cdot x) \cdot \cos(3\pi \cdot x)) (1 - e^{-4x}) - (2i \sin^2(3\pi \cdot x)) (1 - e^{-4x})$$

Improving on the above:

$$= (1 - e^{-4x}) ((3\pi \cdot \sin(3\pi \cdot x) \cdot \cos(3\pi \cdot x)) - (2i \sin^2(3\pi \cdot x)))$$

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot (1 - e^{-4x}) ((3\pi \cdot \sin(3\pi \cdot x) \cdot \cos(3\pi \cdot x)) - (2i \sin^2(3\pi \cdot x))) \text{ Ans.}$$

Problem 6.21

(Aruldas QM Problems With Solution Textbook).

Calculate the probability current density  $j(x)$  for the wave function.

$$\psi(x) := u(x) e^{i \cdot \phi(x)}$$

where  $u$  and  $\phi$  are real.

**Solution:**

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot (\psi^{\text{conj}} \cdot \Delta' \psi - \psi \cdot \Delta' \psi^{\text{conj}})$$

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot \left( \psi^{\text{conj}} \cdot \frac{d}{dx} (\psi) - \psi \cdot \frac{d}{dx} (\psi^{\text{conj}}) \right) \text{ this is our probability current density}$$

$$\psi(x) := u(x) e^{i \cdot \phi(x)}$$

$$\psi_{\text{conj}}(x) := u(x) e^{-i \cdot \phi(x)} \text{ the conjugate expression}$$

$u(x)$  and  $\phi(x)$  are the two functions in  $x$

$$\frac{d}{dx} \psi(x) = \frac{d}{dx} d(u) \cdot e^{i \cdot \phi(x)} + (i) \cdot \frac{d}{dx} \phi(x) \cdot e^{i \cdot \phi(x)} \cdot u(x)$$

$$\frac{d}{dx} \psi_{\text{conj}}(x) = \frac{d}{dx} d(u) \cdot e^{-i \cdot \phi(x)} - (i) \cdot \frac{d}{dx} \phi(x) \cdot e^{-i \cdot \phi(x)} \cdot u(x)$$

Setting up the differentiation expression of the probability current:

$$\begin{aligned} & \left( \psi^{\text{conj}} \cdot \frac{d}{dx} (\psi) - \psi \cdot \frac{d}{dx} (\psi^{\text{conj}}) \right) \\ &= \left( u(x) \cdot e^{-i \cdot \phi(x)} \cdot \left( \frac{d}{dx} d(u) \cdot e^{i \cdot \phi(x)} + (i) \cdot \frac{d}{dx} \phi(x) \cdot e^{i \cdot \phi(x)} \cdot u(x) \right) \right) \\ & \quad - \left( u(x) \cdot e^{i \cdot \phi(x)} \cdot \left( \frac{d}{dx} d(u) \cdot e^{-i \cdot \phi(x)} - (i) \cdot \frac{d}{dx} \phi(x) \cdot e^{-i \cdot \phi(x)} \cdot u(x) \right) \right) \end{aligned}$$

Writing it in a simpler form, since the variable  $u$  and  $\phi$  are functions of  $x$ , making it  $u$  and  $\phi$ :

$$= u \cdot \frac{d}{dx} u + i \cdot u^2 \cdot \frac{d}{dx} \phi - u \cdot \frac{d}{dx} u - i \cdot u^2 \cdot \frac{d}{dx} \phi = 0$$

*Chances of it being zero is possible, depend on expression and its conjugate.*

$$j(x) = \left( \frac{\hbar}{2m} \right) \cdot \left( \psi^{\text{conj}} \cdot \frac{d}{dx} (\psi) - \psi \cdot \frac{d}{dx} (\psi^{\text{conj}}) \right) = \left( \frac{\hbar}{2m} \right) 0 = 0 \text{ Ans Here.}$$

*Solution here different compared to solution in text book by Aruldas. You verify. Textbook solution---*

$$= \frac{\hbar}{2m} \left[ -2iu^2 \frac{\partial \phi}{\partial x} \right] = \frac{\hbar}{m} u^2 \frac{\partial \phi}{\partial x}$$
